### Assignment of the Test Site to a Group

The test site is assigned to a benthic insect community group (Group) based on the 2013 Yukon CABIN model (BEAST Prediction Results). The site is assigned to the Group for which it has the highest probability of belonging based on habitat attributes.

<b>Predictor Variables</b>	Altitude (ft), Longitude, LC-Bryoids (%), LC-Broadleaf open (%), LC-Mixed wood open (%), LC-Wetland herbaceous (%), Precipitation Feb (mm), Precipitation March (mm), Precipitation June (mm), Precipitation July (mm), Rainfall June (mm), April Max temp (C), Average Depth (cm), Average Velocity (m/s)				
<b>Predicted Group</b>	4				
<b>Group</b>	<b>1</b>	<b>2</b>	<b>3</b>	<b>4</b>	<b>5</b>
<b>Probability that the site belongs to each Group</b>	12.5%	24.2%	20.0%	41.7%	1.5%

### Habitat Attributes of Site

This table reports on how the habitat predictor variables measured at the test site compare to the mean habitat predictor variables for the reference sites in the same group.

**Summary Results of the Benthic Invertebrate Data**

The table presents the summary values of the benthic community of the test site compared to expected values and the average benthic community of the reference sites.

	Test Site	Reference Average	Reference Standard Deviation	Expected Families (RIVPACS)
Total Abundance	429	2059.44	1572.86	
Total No. of Taxa	22	12.95	4.37	12.4

**Detailed Results of the Benthic Data**

This table shows how the benthic community of the test site compares to the average of the reference sites to which it is being compared. Both the presence of certain families and their abundance (the number of individuals found) are compared.

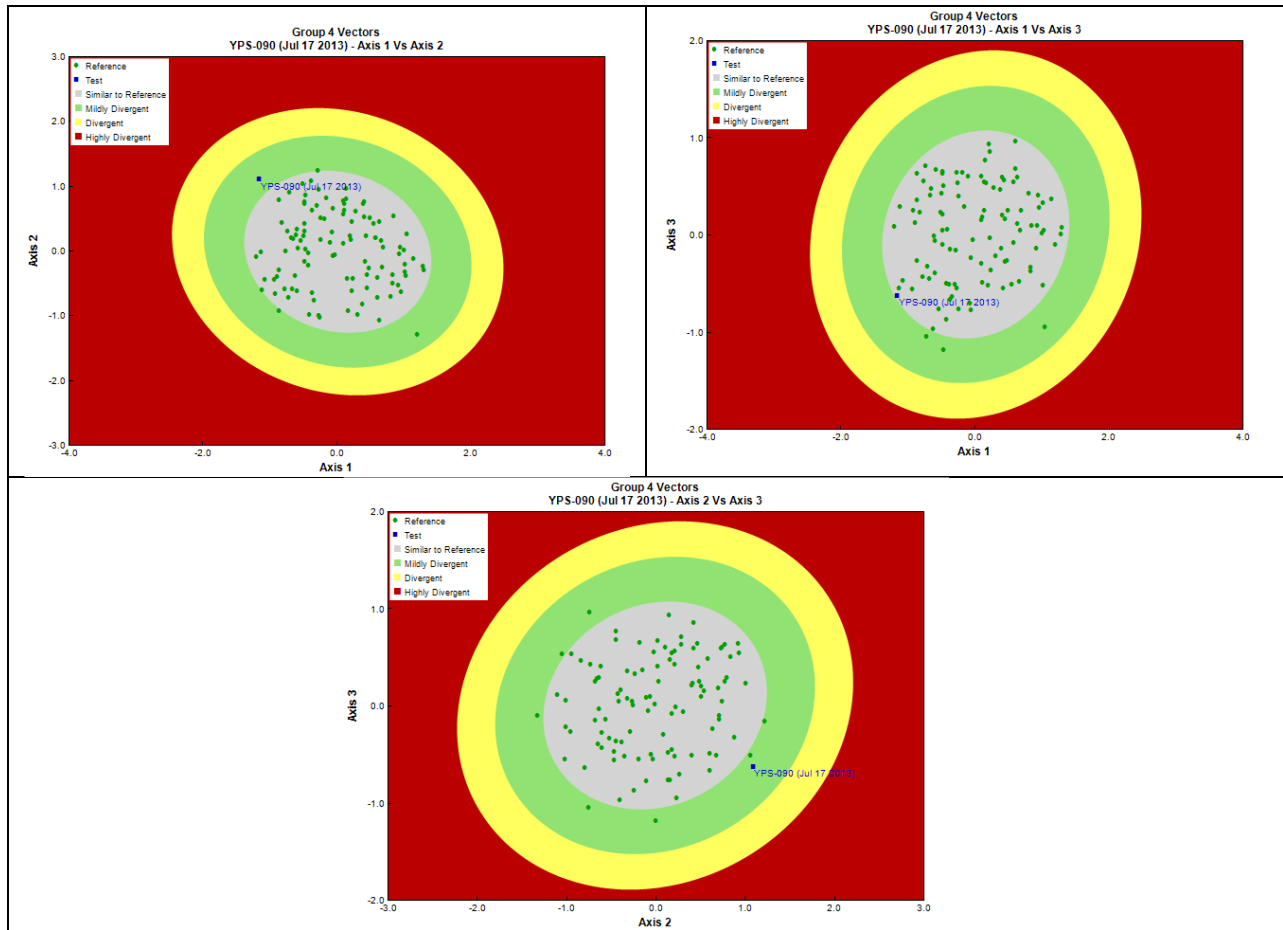

Family (bold = characteristic of group)	RIVPACS Prediction (probability)	Test Site (# of individuals)	Reference Average	Reference Standard Deviation
<b>Chironomidae</b>	0.99	56	911	827
<b>Baetidae</b>	0.81	74	233	309
<b>Nemouridae</b>	0.78	1	130	184
<b>Simuliidae</b>	0.78	1	207	367
<b>Heptageniidae</b>	0.70	76	120	216
Sperchontidae	0.57	0	35	60
Empididae	0.54	11	18	37
Tipulidae	0.53	3	19	41
Chloroperlidae	0.50	1	29	73

Using the predictive model with the RIVAPCS weighted probability of the sites predicted membership, we would expect 12.4 families at this site, and 22 families were observed. Of the nine families expected to occur (P>0.5), only one (Sperchontidae) was absent. All five families characteristic of the group to which this site was predicted were present; however all occurred at much lower numbers than in the reference group. Total abundance was below the normal range, while richness was much higher than expected.

### Visual Reports on Site Condition

This figure displays three site assessment graphs which show the site relative to the group of reference sites to which it is compared. The three axes (or vectors) represent three dimensional space, and the probability bands (from center) are 75 - 90% (Similar to Reference), 90 – 99% (Mildly Divergent from Reference), 99 – 99.9% (Divergent from Reference), and outside 99.9% (Highly Divergent from Reference).

A 0-75% probability band was provided in past annual monitoring reports. Programming is currently being developed in order to incorporate this function into the CABIN model, however at this time the 0-75% band cannot be included here.

### Assessment of Overall Site Condition

Vector 1 vs Vector 2	Mildly Divergent from Reference Condition
Vector 1 vs Vector 3	Similar to Reference
Vector 2 vs Vector 3	Mildly Divergent from Reference Condition
Overall	Mildly Divergent from Reference Condition

Using CABIN, YPS-090 is assessed as Mildly Divergent from Reference Condition.
