

KUDZ ZE KAYAH PROJECT

RECLAMATION AND CLOSURE PLAN

REV 06

May 2026

BMC MINERALS LTD.

This Management Plan has been developed to meet the appropriate subject objectives based on existing regulatory requirements, current or planned site activities, existing and expected site conditions, and designed outcomes at the time of writing. Operational processes/practices for achievement of licence terms and conditions may be updated from time to time as appropriate due to changes to relevant legislation and regulations, changes to site activities or conditions, differences from expected objective outcomes, or improvement of management practices. All rates, capacities, dimensions, weights, volumes and durations in text or figures are based on current feasibility level designs and are subject to change based on final design, licence conditions or site conditions encountered. Updates will be resubmitted to government authorities and/or stakeholders as required.

LIST OF REVISIONS

Issue Date	Revision Number	Description of Revision
September 10, 2020	Rev 00	For Issue to Agencies
November 19, 2020	Rev 01	Updated for with commitments and Final Screening Report Recommendations
January, 2021	Rev 02	Updated with revised closure costs (Appendix E [202012_BMC_ClosureCostEst_Rev01]) based on feedback from YG Energy Mines and Resources and Yukon Water Board Secretariat (YWBS). Specific cost numbers removed from body text (Section 9).
July 18, 2022	Rev 03	Updated with responses to Yukon Water Board Secretariat Information Request #2 and 3 and 4; and final edits from BMC review.
November 14, 2023	Rev 04	Updated with responses to Interventions on the Type A Water Licence Application & responses to Information Requests on the QML Application.
September 19, 2024	Rev 05	Updated in response to Yukon Mineral Resources Branch Information Request 6.
May 20, 2026	Rev 06	Updated in response to Term 47 in the YESAA Decision Document dated April 10, 2026.

SUMMARY OF REVISIONS

Information Request	Document	Exhibit	Section	Revision
Revision 02				
n/a	Reclamation and Closure Plan	1.29.1	9	Removed Tables 9-1 and 9-2 from Rev01
Revision 03				
YWBS IR-2.31	Reclamation and Closure Plan	1.29.1	Glossary	Added definition of “Permanent Closure”
YWBS IR-3.1	Reclamation and Closure Plan	1.29.1	5.1	Replace Figure 5-1 with sealed drawing
YWBS IR-3.1	Reclamation and Closure Plan	1.29.1	5.1	Replace Figure 5-2 with sealed drawing
YWBS IR-2.32	Reclamation and Closure Plan	1.29.1	7.4.1	Revision to clarify second paragraph
YWBS IR-2.32	Reclamation and Closure Plan	1.29.1	7.4.1	Updated Table 7-7 with quantities consistent with Closure Cost Model
YWBS IR-2.32	Reclamation and Closure Plan	1.29.1	7.4.1.1	Updated Table 7-9 with quantities consistent with Closure Cost Model
YWBS IR-2.33	Reclamation and Closure Plan	1.29.1	7.4.2.1	Updated Table 7-12 with quantities consistent with Closure Cost Model
YWBS IR-4.5	Reclamation and Closure Plan	1.29.1	7.6.1	Table 7-17 Updated WQO for Lead and Nitrite
YWBS IR-2.46	Reclamation and Closure Plan	1.29.1	7.9.1	Updated Table 7-24 with physical monitoring frequency consistent with T19-NPV-EOM of Closure Cost Model
YWBS IR-2.39	Reclamation and Closure Plan	1.29.1	8.1	Added clarification on road reclamation during Active Closure
YWBS IR-2.43	Reclamation and Closure Plan	1.29.1	9	Indirect costs revised from 10% to 15%
YWBS IR-2.43	Reclamation and Closure Plan	1.29.1	9.2.16	Indirect costs revised from 10% to 15%
YWBS IR-2.44	Reclamation and Closure Plan	1.29.1	9.2.17	Contingency revised from 20% to 15%
Revision 04				
LFN Intervention (Exhibit 5.6.4): Memo- WQ Model, WTP Predictions, WQO's Report, EQS.pdf	Reclamation and Closure Plan	1.29.1	2.3.1	Added details on proposed establishment of Kaska / BMC Environmental Management Advisory Committee

Information Request	Document	Exhibit	Section	Revision
Please provide additional information on wildlife management considerations, how First Nations and stakeholder concerns have been considered in the plan, and how wildlife management considerations will be considered during reclamation planning.			2.3.5	Added detail on other committees to be established under the proposed modernized SEPA (Management Oversight Committee, Heritage Management Committee) with Kaska and BMC membership. Added BMC's commitment to funding and using Kaska Land Guardians as part of overall environmental management for the project. Also noted the requirement for establishment of the Finlayson Caribou Herd Oversight Committee.
QML IR5A-B	Reclamation and Closure Plan	1.29.1	2.4.4	Updated citation to reference most recent 2023 ARD/ML report.
LFN Intervention (Exhibit 5.6.4): Memo- WQ Model, WTP Predictions, WQO's Report, EQS.pdf Additional sampling of vegetation tissue to characterize elemental composition prior to construction, during operations, and during post-closure is required. Species of cultural importance should be identified and included in the sampling program	Reclamation and Closure Plan	1.29.1	2.5.2	Text on engagement and collaboration with Kaska on revegetation research amended to specifically state "including seeking advice on species of cultural importance that should be included in studies and research". Sampling of vegetation tissue to characterize elemental composition has already been completed as part of baseline environmental assessments, and will continue to be undertaken periodically through the life of the Project.
QML IR5A-B	Reclamation and Closure Plan	1.29.1	2.5.3, 7.6.2.1	Updated citation to reference most recent 2022 water quality model report. Updated modelled water quality in Table 7-19.
QML IR5A-B	Reclamation and Closure Plan	1.29.1	2.5.4	Updated citation to reference most recent 2022 water quality model report and updated wording to be consistent with recent changes to the water quality model.
LFN Intervention (Exhibit 5.6.4): Memo- WQ Model, WTP Predictions, WQO's Report, EQS.pdf Table 3-1: Fundamental Mine Reclamation and Closure Objectives (YG, 2013) in the Reclamation Plan excludes Land Use requirements that "site access is consistent with community land use expectations."	Reclamation and Closure Plan	1.29.1	3.1	Added additional land use objective that had been inadvertently excluded from Table 3-1.
QML IR5A-B	Reclamation and Closure Plan	1.29.1	4.2	Updated to include data from 2019 – 2023 from Ensero Baseline Hydrometeorology report.
QML IR5A-B	Reclamation and Closure Plan	1.29.1	4.3.1	Updated to include data from 2019 – 2023 from Ensero Baseline Hydrometeorology report.
QML IR5A-B	Reclamation and Closure Plan	1.29.1	4.3.2	Updated to include data from 2019 – 2023 from Ensero Baseline Surface Water report.
QML IR5A-B	Reclamation and Closure Plan	1.29.1	4.4	Updated to include data from 2019 – 2023 from Ensero Baseline Hydrogeology report.
QML IR5A-B	Reclamation and Closure Plan	1.29.1	4.6	Updated to add data from 2019 – 2023 from Ensero Baseline Ungulate report and 2023 site characterization plan (Rev 3). Updated data in sections 4.6.1 and 4.6.2

Information Request	Document	Exhibit	Section	Revision
QML IR5A-B	Reclamation and Closure Plan	1.29.1	5.2.1	Updated citation to reference most recent 2023 ARD/ML report.
LFN Intervention (Exhibit 5.6.4): Memo- WQ Model, WTP Predictions, WQO's Report, EQS.pdf Confirmation that all soil disturbed by mining activities will be salvaged for use in reclamation is required	Reclamation and Closure Plan	1.29.1	5.2.1	Added statement confirming that all soil disturbed by mining activities will be salvaged for use in future reclamation activities.
QML IR5-73	Reclamation and Closure Plan	1.29.1	6.6, 7.6.1, 7.9.2, 7.10.2, 9.2.15	Updated reference to the Environmental Monitoring, Surveillance, reporting and Adaptive Management Plan to either the 2023 Environmental Monitoring Plan or 2023 Adaptive Management Plan.
LFN Intervention (Exhibit 5.6.4): Memo- WQ Model, WTP Predictions, WQO's Report, EQS.pdf Table 7-1: General Reclamation and Closure Objectives and Measures identifies Ecological Conditions and Sustainability as the primary value and states, "Revegetation strategies are informed by a comprehensive terrestrial ecosystem mapping inventory of pre-existing conditions. Revegetation prescriptions for disturbed areas will balance the objectives of restoring like ecosystems with erosion stabilization and stability monitoring objectives." The revegetation prescriptions should also consider traditional foods and medicines and input from the Kaska.	Reclamation and Closure Plan	1.29.1	7.1	Added suggested revegetation prescription to Table 7-1.
LFN Intervention (Exhibit 5.6.4): Memo- WQ Model, WTP Predictions, WQO's Report, EQS.pdf The Proponent states that stockpiled topsoil and overburden materials were assumed to be nutrient poor based on experience at other metal mines in BC and Yukon. A site-specific soil survey is required to address this data gap.	Reclamation and Closure Plan	1.29.1	7.1.2	Clarified that this has also been confirmed through baseline soil sampling and referenced relevant baseline report.
LFN Intervention (Exhibit 5.6.4): Memo- WQ Model, WTP Predictions, WQO's Report, EQS.pdf The Proponent states: "Ideally, storage of soil in low berms, less than 1 m deep, re-vegetating stockpiles, and staging progressive reclamation to minimize soil storage times help retain soil nutrients and biota and improves revegetation success (Strohmayer, 1999). However, stockpile depth needs to be balanced with minimizing the footprint of surface disturbance." Additional details and confirmation that berm height can be achieved are required to ensure that the already limited soil nutrients and biota will be retained to ensure revegetation success.	Reclamation and Closure Plan	1.29.1	7.1.2	Added additional information on principles that BMC will adopt for management of topsoil to promote maintenance of topsoil health until reused in reclamation.

Information Request	Document	Exhibit	Section	Revision
YG Intervention (Exhibit 5.2) Recommendation 60	Reclamation and Closure Plan	1.29.1	7.9.2	Added monitoring stations KZ-5 and KZ-5D to summary of closure period surface water table 7-25.
LFN Intervention (Exhibit 5.6.4): Memo- WQ Model, WTP Predictions, WQO's Report, EQS.pdf Vegetation assessments required to evaluate the success of reclamation activities must also include: -Evaluation of soil and vegetation tissue for metal content; -Evaluation of soil establishment; and -Study of biodiversity, wildlife use, and/or sightings,	Reclamation and Closure Plan	1.29.1	7.9.3	Updated text to specifically note monitoring of soils for metal content and soil establishment.
Revision 05				
QML IR6-1 Provide definitions or explanations for the following terms used throughout the plan: a. Passive water treatment technology b. Semi-passive water treatment technology c. Reclamation d. Restoration e. Inert materials f. Non-inert materials g. Landform	Reclamation and Closure Plan	1.29.1	Glossary	Necessary terms have been added to the glossary, while unnecessary terms have been removed from the document.
QML IR6-8 Table 7-2 provides post-mining land use conditions, provide a similar table that describes pre-impact conditions of the site. This table should be added to Section 4 of the RCP.	Reclamation and Closure Plan	1.29.1	4.5	Added more details of baseline vegetation conditions, including a table describing pre-impact conditions.
QML IR6-5 The definition for Permanent Closure should not include "and all other activities as authorized" as reclamation and closure of the site is an activity that is authorized.	Reclamation and Closure Plan	1.29.1	Glossary	This definition has been revised.
QML IR6-16 Where an alternative was listed as being preferred for "amenability to reclamation" was not chosen as the closure method, provide additional rationale for why an alternative was chosen. (Table 2-4).	Reclamation and Closure Plan	1.29.1	2.4.3	Additional information has been included supporting the selection of the preferred alternative.

Information Request	Document	Exhibit	Section	Revision
QML IR6-18 The alternatives considered for waste covers do not show how each alternative was rated and screened against the stated criteria. Provide more detail on how each alternative was assessed based on the stated criteria and the rationale for the chosen method.	Reclamation and Closure Plan	1.29.1	2.4.4	Provided additional information on the assessment of each alternative against the stated criteria and the rationale for alternative selection.
QML IR6-23(l) Risk No 11.1: The mitigation identified is inconsistent with what is presented in the RCP. RCP states that placement of a 0.25m to 0.50m isolation cover would be an appropriate practice but it is not clear that there is a commitment to do this.	Reclamation and Closure Plan	1.29.1	6.3	Provided clarification of the proposed Class A and Class B cover in the event of temporary closure.
QML IR6-24 Aspects of the closure plan that require further research or development to demonstrate effectiveness require timelines for the implementation of the relevant research/development and, where applicable, expected completion. Timelines should include expectations of when results would become available and how these results will be incorporated into future iterations of the plan.	Reclamation and Closure Plan	1.29.1	2.5	Provided additional details of research timelines and incorporation of results into RCP updates.
QML IR6-26 Section 7.1.2, and Table 7-2, describe how waste management facilities will be revegetated to promote conditions similar to baseline conditions, with varying vegetation across facilities. Provide a description of how the research program will be tailored to understand the how the proposed cover systems will support the vegetation species proposed and identify additional closure measures to achieve objectives.	Reclamation and Closure Plan	1.29.1	7.1.2	Provided additional details of how research programs will evaluate potential revegetation approaches for the waste management facilities.
QML IR6-29 Section 2.5.3 and Appendix C of the RCP describe the studies that have been completed in relation to in-pit water treatment. Details are not provided for ongoing research and pilot studies to confirm the expected performance, optimize designs, and ensure timely implementation as is required in Decision Document term 3. Provide additional detail with respect to program design and timing for the ongoing research of in-pit treatment.	Reclamation and Closure Plan	1.29.1	2.5.3	Additional details and clarification added regarding ongoing data collection and studies to support design and implementation of in-pit water treatment.

Information Request	Document	Exhibit	Section	Revision
QML IR6-30 Decision Document term and condition 31 requires that types of treatment alternatives and their implementation timelines be provided an Adaptive Management Plan. This is required to include a modelling and monitoring approach including trigger values for when alternatives must be implemented and, if monitoring shows exceedances and alternative treatment is implemented, how discharges will be addressed until new water treatment becomes operational. Provide details on how the AMP will inform the reclamation research program and future revisions of the RCP.	Reclamation and Closure Plan	1.29.1	7.2	Added an Adaptive Management Initiative for ABM Lake water treatment.
QML IR6-38 A temporary isolation cover is identified as 'the most appropriate practice' to minimize risks from Class A and B material in a temporary closure scenario. Additional information is required to understand the proposed actions in a temporary closure scenario. a. Provide clarification whether this is a commitment BMC is making in any temporary closure scenario. b. Provide additional information on when this would occur in a temporary scenario (i.e. immediately upon closure, within a specified timeframe etc.) c. If there are specific thresholds that must be met to warrant the placement of an isolation cover, provide details of these thresholds and how they were developed	Reclamation and Closure Plan	1.29.1	6.3	Provided additional text for clarification.
QML IR6-42 Reclamation and closure measures for roads and trails are not specified in the RCP. Provide information on the removal and reclamation of roads and trails. This should include the sequence of removal to illustrate which roads will be required for the closure of the site itself and the timing for removal of roads based upon closure phases.	Reclamation and Closure Plan	1.29.1	7.9	Reclamation and closure measures for roads and trails have been added to the Plan. The expected timing for closure and reclamation of the Access Road and Site Roads has been added to the Plan.
QML IR6-44 Table 7-20 is missing Chemical Stability as a value; this is an important value in the context of contaminated soils and foundations in the industrial area and areas where mobile equipment and fuel are stored. Include chemical stability as a value in this table.	Reclamation and Closure Plan	1.29.1	7.7	Chemical Stability has been added as a value to Table 7-23.

Information Request	Document	Exhibit	Section	Revision
QML IR6-47 If concrete footings, foundations, and slabs will be closed in place, provide additional information on the confirmatory sampling that will occur prior to closure to ensure migration of contaminants beneath the infrastructure has not occurred.	Reclamation and Closure Plan	1.29.1	7.7.2.2 and 7.7.2.9	Commitment added to the Plan that confirmatory sampling will be completed prior to covering with suitable growth media.
QML IR6-50 The RCP notes that material remaining on the run of mine pad and in low grade ore stockpiles do not 'necessarily require relocation' and would be encapsulated within the Class B facility at closure. It is not clear if there are thresholds, whether based on volumes present at closure or the grade and geochemistry of material, that would indicate if relocation to other facilities such as the Class A facility or the open pit would be warranted.	Reclamation and Closure Plan	1.29.1	7.5.1	Provided additional text for clarification.
QML IR6-54 The post-closure water management infrastructure is not clearly outlined in the RCP, Table 7-8 indicates that there will be "appropriately sized drainage diversions around the facility to reduce up slope run-on waters" while Table 7-16 indicates that all infrastructure will be removed. Provide clarification on the water management infrastructure that will be in place post-closure, particularly around the Class A and Class B facilities.	Reclamation and Closure Plan	1.29.1	7.4 and 7.6	Removed unclear wording and added additional text for clarification.
QML IR6-69 During Active Closure the requirement for annual physical monitoring will remain unchanged. Update Table 7-24 to reflect an annual requirement for physical monitoring.	Reclamation and Closure Plan	1.29.1	7.11.1	Revised monitoring frequency during Active Closure.
QML IR6-70 The Transition Closure phase will be the first stage to monitor physical stability following the implementation of the closure plan. Annual physical monitoring will remain a requirement in this phase until continued physical stability is demonstrated. Update Table 7-24 to include an annual requirement for physical monitoring for this stage.	Reclamation and Closure Plan	1.29.1	7.11.1	Revised monitoring frequency during Transition Closure.

Information Request	Document	Exhibit	Section	Revision
QML IR6-73 Brushing of deep rooting vegetation species is identified as a maintenance measure to protect covers placed. Provide clarification of the species being planted on site that may have rooting depths that would negatively impact cover systems and describe the revegetation practices that will be implemented to reduce the likelihood of this occurring.	Reclamation and Closure Plan	1.29.1	7.11.3	Removed discussion of deep rooting vegetation from the RCP, as no such vegetation is planned or expected.
QML IR6-76 Update the monitoring and maintenance activities associated with wildlife to reflect the caribou effects monitoring and mitigation program (Decision Document term 38) and the late-winter moose monitoring survey (Section 110E).	Reclamation and Closure Plan	1.29.1	7.11.3	Added a reference to the Wildlife Protection Plan.
QML IR6-77 Provide clarification on Table 7-2 with respect to revegetation objectives and the potential for wildlife use and how these uses will be monitored to inform the success of the closure measures.	Reclamation and Closure Plan	1.29.1	7.1.2	Added details of how potential for wildlife use was assessed in Table 7-2.
Revision 06				
YESAA Decision Document Term 47 Financial security for the Project should be based upon the peak liabilities in a 5-year period from the point of determination and should not account for revenues generated during the closure period.	Reclamation and Closure Plan	1.29.1	9.3 and Appendix E	Provided a calculation of the peak liabilities in a 5-year period from the point of receipt of a Quartz Mining Licence and a Type A Water Licence.

LIST OF ACRONYMS AND ABBREVIATIONS

AEG	Alexco Environmental Group Inc.
AMI	Adaptive Management Initiative
AMP	Adaptive Management Plan
ARD	Acid Rock Drainage
BC ENV	British Columbia Ministry of Environment and Climate Change Strategy
BMC	BMC Minerals Ltd.
CCME	Canadian Council of Ministers of the Environment
COSEWIC	Committee on the Status of Endangered Wildlife in Canada
COPI	Constituents of potential interest
CWTS	Constructed Wetland Treatment System
EMP	Environmental Monitoring, Surveillance and Reporting Plan
EMR	Energy, Mines and Resources
FMEA	Failure Modes Effects Assessment

ROM	Run of Mine
RRDC	Ross River Dena Council
TK	Traditional Knowledge
TLU	Traditional Land Use
UWMP	Upper Water Management Pond
WQO	water quality objective
WTP	Water Treatment Plant

WMF	Waste Management Facility
YESAB	Yukon Environmental and Socio-Economic Assessment Board
YG	Yukon Government

GLOSSARY

Ablation: The removal of snow and ice by melting or evaporation.

Active Closure: Post mining removal of Water Management Ponds, Overburden Stockpile, collection ponds, removal of all pipeworks and structures, and the removal and re-grading of all access roads, ditches and borrow areas not required during closure phases.

Authigenic: Authigenesis is the process whereby a mineral or sedimentary rock deposit is generated where it is found or observed.

Bench-scale: Testing of materials, methods, or chemical processes on a small scale, such as on a laboratory worktable.

Biological Soil Crust: Early successional communities composed of bacteria, cyanobacteria, algae, mosses, liverworts, fungi and lichens.

Brunisol: A weakly developed mineral soil with a sufficiently developed B horizon that distinguishes it from a regosol.

Colluvium: Material that accumulates at the foot of a steep slope.

Construction Phase: Project phase that will last approximately 2 years and includes Project site preparation and clearing and establishment of Project infrastructure.

Contact Water: Surface water or other water that comes into contact with disturbed surfaces in the Mine site footprint and associated infrastructure.

Cryosol: Permafrost soils.

Decommission: To take facilities out of service.

Ecoregion: Ecoregions represent smaller areas of ecozones characterized by distinctive physiography and ecological responses to climate as expressed by the development of vegetation, soil, water, and fauna.

Ecosite: An area of vegetation association related to a combination of moisture and nutrient regimes specific to an ecoregion.

Ecozone: Ecozones are large and generalized ecological units characterized by interactive abiotic factors. Five ecozones are recognized in Yukon: Southern Arctic, Pacific Maritime, Taiga Plain, Boreal, and Taiga Cordillera.

Edatopic Grid: A grid of moisture and nutrients used to define the variability of soil and vegetation types for a given region.

Effluent: Liquid waste discharge.

Fluvial: Of or found in a river.

Fungi: A general term used to denote a group of eukaryotic protists, including mushrooms, yeasts, rusts, molds, and smuts, etc., characterized by the absence of chlorophyll and by the presence of a rigid cell wall composed of chitin, mannans, and sometimes cellulose.

Geochemical: The related chemical and geological properties of a substance.

Graminoid: Herbaceous plants with a grass-like morphology, includes the families Poaceae (grasses), Cyperaceae (sedges), and Juncaceae (rushes). Graminoids are often dominant in open habitat comprising grasslands, marshes, and alpine meadows.

Growth Media: A combination of overburden and topsoil media demonstrated to facilitate growth.

Heterogeneity: The uneven distribution of features and/or species in an area.

Hydraulic: Denoting, relating to, or operated by a liquid moving in a confined space under pressure.

Infiltration: The process by which water on the ground surface enters the soil.

Influent: Water, wastewater, or other liquid flowing into a reservoir, basin, pond, or treatment plant.

Inoculation: The act of introducing microorganism or suspension of microorganisms (e.g., bacteria) into a culture medium.

Kaska (i.e., Kaska First Nations): Transboundary Nations involving Kaska people from the Ross River Dena Council and Liard First Nation in southeastern Yukon, and Daylu Dena Council, Dease River First Nation and Kwadacha Nation in northern British Columbia.

Landform: A feature on the Earth's surface that is naturally formed, or mimics naturally formed features.

Liability: The state of being responsible for something, especially by law.

Mesic: An environment or habitat characterized by a moderate amount of moisture.

Microenvironment: The immediate small-scale environment of an organism or a part of an organism, especially as a distinct part of a larger environment.

Operations Phase: Project phase that will last approximately 10 years and includes open pit ABM open pit and underground development, and ore processing.

Overburden: Rock or soil overlying bedrock or other underground feature.

Passive Water Treatment Technology: Water treatment technology that does not require regular human intervention to operate.

Permafrost: Soil, rock or sediment that is frozen for more than two consecutive years. In areas not overlain by ice, it exists beneath a layer of soil, rock or sediment, which freezes and thaws annually that is called the “active layer”.

Permanent Closure: Means the closure of the Undertaking, with no intent for restart, as evidenced by notice from the Licensee, or the cessation of all mining and ore processing activities for any period of time longer than six (6) consecutive months, that is not a Temporary Closure.

Pilot-scale: A small scale, preliminary study or test conducted to evaluate feasibility, time, cost, adverse events, and effect size in an attempt to predict results and improve upon the design prior to performance of a full-scale study or operation.

Post-closure Phase: Project phase that is assumed to begin once all physical activities have finished onsite and will continue until active monitoring is no longer required.

Prill: A small aggregate or globule of a material, most often a dry sphere, formed from a melted liquid.

Project Area: Refers to the general Project location and surrounding area.

Project Footprint: Refers to the area in which the Project Infrastructure will be located and is the area of direct disturbance from the Project activities.

Reclamation: The process of returning the land impacted by Project activities to a state that is compatible with a healthy environment and traditional land use activities.

Regosol: A very weakly developed mineral soil in unconsolidated materials often in mountainous regions.**Slaking Systems:** A system for slaking, the process, by adding water, of turning the traditional building material lime from calcium oxide into calcium hydroxide.

Soil Amendment: any material added to a soil to improve its physical properties, such as water retention, permeability, water infiltration, drainage, aeration and structure.

Solifluction: The gradual movement of wet soil or other material down a slope, especially where frozen subsoil acts as a barrier to the percolation of water.

Subaqueous: Under water.

Tailings: The material remaining after processing of ore to remove the valuable minerals in the ore.

Temporary Closure: closure of the undertaking as evidenced by the cessation of development and production authorized by the QML and Type A Water Licence for a period longer than six (6) consecutive months and is not expected to last longer than five years and can include both planned and unplanned closure (Yukon Energy, Mines and Resources, 2013).

Till: Unsorted material deposited directly by glacial ice and showing no stratification.

Transition Closure: The period when the ABM open pit is filling with water, and reclamation activities have been completed for the Class A, B and C Storage Facilities. A Constructed Wetland Treatment System will be constructed in Geona Creek and collection ponds will be removed.

Upgraded Tote Road: The widening, re-grading of the Tote Road between the Camp and the ABM Deposit.

Vegetation Association: Group of plant species that occur together on a given area of land with a similar nutrient and moisture regime.

1 INTRODUCTION

BMC Minerals Ltd. (BMC) is the owner of the Kudz Ze Kayah (KZK) Project (the Project). Since acquiring the Project in 2015, BMC has actively engaged in assessing historical work, optimizing design, resource drilling, economic assessment, baseline environmental studies, and First Nations and community engagement as well as the successful completion of the Executive Committee Screening by the Yukon Environmental and Social-Economic Assessment Board.

The Reclamation and Closure Plan (RCP) presents a methodical approach designed to deliver sound, appropriate, and responsible closure of the Project that meets predetermined goals and objectives.

The following planned Project closure goal is grounded in responsible stewardship, consultation with stakeholders and appropriate end land use considerations:

- To return the Project site and affected areas to viable and, wherever practicable, self-sustaining ecosystems that are compatible with a healthy environment and with Traditional Land Use (TLU) activities.

The RCP is based on Yukon Government's (YG) guidance document *Reclamation and Closure Planning for Quartz Mining Projects* (YG, 2013). The RCP is presented at a level of detail appropriate to ensure that closure measures:

- Support the Project's planned closure goals and objectives;
- Are technically feasible and practical to achieve;
- Support the evaluation of potential environmental and socio-economic effects from the Project in the Closure and Post-closure phases; and
- Are defined adequately to support the cost estimate of the reclamation and closure liabilities.

The RCP addresses the entire planned Mine development footprint excluding the Access Road (the updated Tote Road from kilometer 0 at the Robert Campbell Highway to kilometer 18.88 just south of the Finlayson Bridge crossing). The Access Road is excluded as it is not part of the Quartz Mining Licence Application and instead is permitted under a separate Yukon Government Lands Lease.

The RCP presents progressive reclamation and reclamation research plans that will be undertaken leading up to and through Construction and Operations. Closure measures are presented regarding decommissioning and reclamation work in the Active Closure period, and subsequent reclamation and water management measures specific to the Transition Closure and Post-closure periods. Monitoring and maintenance programs spanning all closure periods are also outlined in this RCP.

During the reclamation and closure planning to support Mine design decisions, a key design feature included physical segregation of non-potentially acid generating (NPAG) and low Metal Leaching (ML) materials and non-processing activities on the eastern slope of the Geona Creek Valley, while all processing activities and PAG/ML waste material are designed to be contained on the western slopes of the Geona Creek Valley.

2 RECLAMATION AND CLOSURE PLANNING

The overall strategy for the RCP is to ultimately provide a closure condition that requires minimal management and maintenance to deliver, with Mine facilities decommissioned and reclaimed, and monitoring conducted until mitigation measures have achieved the Closure objectives. The focus of the RCP is to guide the site to appropriate and functional ecosystems, while meeting agreed key end land use objectives.

This section outlines the framework adopted and utilized to establish a specific set of closure goals, objectives, criteria, and measures for the Project, and explains the distinctions and linkages between them.

2.1 CLOSURE OBJECTIVES, PRINCIPLES, AND REGULATORY GUIDANCE

The closure guidance document (YG, 2013) contains direction on the level of detail, information required and processes necessary for developing the RCP. The guide has the following objectives:

- Describe the context for Mine closure planning in Yukon and the rationale for requirements to submit RCPs and liability estimates;
- Describe the principles, philosophy, and broad objectives for closure planning for Yukon mining projects;
- Describe the information expectations for RCPs and liability estimates;
- Provide draft text that will be included in the regulatory submission documents; and
- Identify key sources of additional guidance for preparing RCPs and liability estimates.

Principles and approaches presented by the guidance document include fundamental reclamation and closure objectives, community and regulatory engagement, reclamation and closure principles, and principles for estimating liability (YG, 2013). The guidance document identifies the following global principles for reclamation and closure planning for mining projects in Yukon:

- Design for closure;
- Reducing impacted water;
- Source control (contaminant);
- Progressive reclamation;
- Minimize long-term activities, plan for long-term monitoring and maintenance; and
- Adaptive management is not a reclamation plan.

Specific Project closure measures need to be demonstrably linked to sound goals and objectives for overall closure of the site. These measures will be adjusted over time to consider new information that may become available during the operating and closure periods of the Mine life to support achievement of the key objectives. Principles and approaches for reclamation planning at the Project begin with following the YG guidance document (YG, 2013).

Section 2.3 provides a high-level summary of BMC's engagement with Kaska to date as it relates to reclamation and closure. Dialogue and involvement of Kaska representatives will be ongoing throughout all Project phases and therefore, the closure goals and objectives (Chapter 3) and closure measures (Chapter 7) are expected to be refined from time to time as a result of this ongoing engagement.

Reclamation planning for the Project is based upon the establishment of specific closure goals, objectives, criteria, and monitoring programs for the Project. These are defined by environmental conditions, site conditions, and company and community expectations. Project reclamation planning considers the global principles presented above for all stages of Mine closure.

The closure goals of the RCP guide the selection of clear, specific objectives for all Project components. A set of closure measures that could achieve the objective are developed and its success or appropriateness is monitored over time. Where required and based on the ongoing monitoring of results, closure measures may be adjusted for efficacy. Measurable closure criteria (design or performance) define success in achieving the specific closure objective, as determined through the associated design and monitoring initiatives.

Figure 2-1, adapted from the *Guidelines for the Closure and Reclamation of Advanced Mineral Exploration and Mine Sites in the Northwest Territories* prepared by the Mackenzie Valley Land and Water Board and Aboriginal Affairs and Northern Development Canada (MVLWB/AANDC, 2013) provides an overview of this approach to the development of the RCP.

Details defining this approach are presented in Section 2.2 and Chapter 3. Sources are cited where information was gathered from additional authors.

Figure 2-1: Approach to Closure and Reclamation Planning

2.2 PROJECT CLOSURE GOAL

The closure goal is the guiding statement and starting point for closure and reclamation planning. The purpose of establishing this goal is to ensure the long-term success of the program by developing a clear and executable plan. The closure goal is achieved once the proponent has satisfied closure objectives.

The following Project closure goal is grounded in responsible stewardship, consultation with stakeholders and appropriate end land use considerations:

- To return the Project site and affected areas to viable and, wherever practicable, self-sustaining ecosystems that are compatible with a healthy environment and with Traditional Land Use (TLU) activities.

2.3 FIRST NATION AND STAKEHOLDER ENGAGEMENT

BMC has developed a Consultation and Engagement Plan which sets out the tools, techniques and context for consulting with the entire suite of governments (including First Nation governments), agencies, boards, organizations and stakeholder groups with whom BMC will continue to engage through licensing, operation and closure of the Project. Techniques described in the Consultation and

Engagement Plan will ensure that licensing, operations, and closure of the planned Project is supported by thorough, formal consultation.

Beyond the activities and approaches set out in the Consultation and Engagement Plan, BMC has worked extensively with affected First Nations, governments and other interested parties to ensure there is broad public understanding and support for the Project.

2.3.1 Ross River Dena Council

BMC has had extensive engagement with Ross River Dena Council (RRDC) including community meetings in Ross River, Elders Oversight Committee Meetings, meetings with Chief and Council and engagement with RRDC's wholly owned environmental consultancy, Dena Cho Environmental and Remediation Inc. (Dena Cho). Key concerns, as they relate to Closure and how BMC has addressed those concerns, are summarized in Table 2-1. It is noted that many of the concerns were addressed as part of the Failure Modes Effects Assessment (Appendix A) in which both Dena Cho and two Elders nominated by RRDC participated. Prior to this RCP being finalized Dean Cho conducted a detailed independent review of the draft RCP. Issues raised during the Dena Cho review were addressed collaboratively through a number of workshops and where appropriate the RCP was amended and additional commitments added.

Table 2-1: Summary of Consultation with RRDC on Closure Plan

Concern	BMC Response
Efficacy of the Constructed Wetland Treatment System	Improvements to the liners and covers of the Class A and B Waste Storage Facilities have resulted in the Constructed Wetland Treatment Systems being a contingency measure rather than relying on them for the long-term treatment of water. All water quality predictions show that the water will meet the guidelines during Closure phases. Although the wetlands are now considered a contingency measure, BMC has initiated a comprehensive program to design, test, optimize, implement and maintain constructed wetlands in a site-specific manner for the Post-closure phase.
Efficacy of the ABM lake Water Treatment	Off site testing was initiated in 2018 and is ongoing. Given the duration it will take to fill the ABM open pit, there are many years available for monitoring to ensure the treatments are working and if not, additional or amended treatments can be added to the plan. The water treatment plant (WTP) will remain in place during the Active and Transition Closure phases and will not be decommissioned until satisfactory in situ treatment has been demonstrated in the field. This contingency measure will ensure that downstream water quality is not adversely affected during the implementation of the Closure mitigation plans.
Draw down of water in South Lakes and adaptive management strategies	Management strategies to reduce the effects from a reduction of flows and water levels in the receiving environment of South Lakes, once Fault Creek is diverted back to its original path, will be based on the amount of reduction observed during monitoring. Management options may include a partial diversion of Fault Creek both to the ABM open pit and to the South Lakes. As there is currently minimal winter flow into the upper South Lakes, negligible impacts to fish and fish habitat are predicted to result from a reduced winter flow during the Active and Transition Closure phases. Further, although a slightly reduced volume of groundwater entering the uppermost lake is predicted, lake levels are primarily controlled by very old beaver impoundments and therefore any reduction in lake surface area, due to the reduction in groundwater inputs, would be considered negligible.
Reduced flows in creeks compared to baseline	The greatest reduction in streamflow in Finlayson Creek is predicted to occur during Active and Transition Closure. Flows in Finlayson Creek are predicted to decrease from baseline in the range of 12% at monitoring station KZ-15 and 5% at KZ-26 during these phases due to groundwater and surface water flows filling the ABM lake. Once the pit is filled (i.e., after the Transition Closure phase) flows in Finlayson Creek will return to baseline conditions.

Concern	BMC Response
	The Post-closure phase begins in approximately Year 24 and is characterized by the beginning of ABM lake outflow, which will recommence contributing flow to Geona Creek, thereby reconnecting Fault Creek and the other south diversion areas to Geona Creek.
Impacted groundwater flowing south from the pit into the South Lakes watershed	The ABM open pit will be a groundwater sink during the Operations phase, which means that groundwater will flow radially towards the open pit and no seepage will leave the open pit during this phase. In Post-closure, groundwater modelling indicates that groundwater will continue to flow into the ABM lake from the South Lakes watershed and will then flow north from the ABM lake into the Geona Creek watershed.
The preferred tailings management technology is for dry stack tailings; RRDC does not support submerged valley tailings with dams in the long term	BMC has committed to encapsulated dry stack tailings as part of the closure plan.
Monitoring the performance of the Class A Storage Facility during closure	BMC has committed to ongoing monitoring for 10 years Post-closure and as per the agreements with Kaska, all reports will be provided to their chosen consultant for review.
Vegetation and soils monitoring during closure	During Active Closure the site will be reclaimed and monitored to ensure soils and vegetation meet the relevant standards or site-specific health-based values.
Bonding	Security Bonds will be provided to YG.
Reclamation of Access Road	During community meetings and Elders Oversight Committee meetings some RRDC members requested that the Access Road not be reclaimed but left open for traditional land use purposes. BMC's lease for the road requires that it be fully reclaimed; however, BMC made a commitment to participate in multi-party discussions (i.e. RRDC, Yukon Government, stakeholders) on this matter as the Project progresses.

BMC and RRDC are both signatories to an agreed Traditional Knowledge (TK) protocol. In accordance with the TK Protocol, when new Traditional Knowledge is shared, both parties will collaboratively identify any new potential effects as well as any additional mitigation measures that may be required over the life of the Project. This RRDC elder-specific Kaska TK information may also help inform the Closure objectives.

BMC and Ross River Dena Council (in its role as lead community for the Kaska Nations, including Liard First Nation) are parties to an existing Socio-Economic Participation Agreement (SEPA) for the KZK Project. In 2019, BMC and RRDC signed a Letter of Intent committing the parties to a modernization process for the existing SEPA. In March 2021, BMC proposed a modernized SEPA to all Kaska leadership. The proposed SEPA includes provision for establishment of a Kaska/BMC Environmental Management Advisory Committee (EMAC). Under the current proposal before Kaska, this committee will be tasked with, among other things, reviewing and providing input into environmental management plans, reporting on implementation of those plans, reviewing monitoring plans/results, and reviewing incident reports and reporting back to Kaska members.

2.3.2 Liard First Nation

Since 2015 BMC has held community meetings in Watson Lake, met with Liard First Nation (LFN) Chiefs and Councils when possible, and hosted site tours with LFN government representatives and LFN Elders.

BMC signed an agreement with LFN in June 2019 that provided a mechanism for BMC to fund LFN activities, ranging from Project plan review to collection and sharing of non-confidential TK and TLU

information. The agreement provided funding to LFN to support a formal technical review of the Project, as well as the preparation and sharing of a summary TLU/TK report as well as an opportunity for BMC to review draft technical reports prior to submission to YESAB. At the time of preparing this RCP, LFN had not yet provided BMC with the draft TLU/TK report; however, LFN had provided YESAB with a detailed review of the Project Proposal and provided additional input to YESAB as follow-up to BMC's responses to YESAB. The original funding agreement has now ended, and BMC has offered additional capacity funding for LFN's continued participation in the licensing review process.

LFN's key concerns with respect to Closure, as expressed throughout the YESAB process, related to the potential for the site not to be reclaimed as per the Conceptual Reclamation and Closure Plan (presented in the Project Proposal (BMC, 2017)). The concern was that the land and water would not be returned to a state where Traditional land use activities could be resumed. BMC addressed the concerns through correspondence during the Environmental Assessment process and through efforts at ongoing consultation directly with LFN. In addition, this RCP provides additional details with respect to ensuring chemical stability of the site in the Closure and Post-closure phases of the Project. Based on the detailed information presented herein, BMC is confident that the defined Closure Objective "*To return the Project site and affected areas to viable and, wherever practicable, self-sustaining ecosystems that are compatible with a healthy environment and with Traditional Land Use (TLU) activities*" will be achieved.

As part of LFN's ongoing review of the Project, in November 2020 BMC's technical hydrology team met with LFN's technical hydrology consultants and much of the discussion focussed on the passive treatment systems described in this RCP.

BMC has committed to utilizing any LFN input made either directly to BMC, through the ongoing licensing process (as has been done arising from LFN's intervention response to the Project's Type A Water Licence application), or through the EMAC to inform detailed Project management plans and site operations over the life of the Project. Any additional commitments or modifications can be added to the next iteration of this RCP as per the two-year requirement for it to be updated.

2.3.3 Federal and Territorial

Engagement with Yukon and Canadian government agencies has been ongoing since acquisition of the Project in 2015. Between 2015 and 2024 staff from various territorial regulatory agencies, including Department of Energy, Mines and Resources (EMR), Yukon Water Board, Water Resources and Major Projects, as well as federal representatives from Fisheries and Oceans Canada and Northern Projects Management Office, participated in site visits.

Meetings with EMR around consultation processes for the Quartz Mining License (QML) took place prior to BMC submitting its application for the QML. BMC also met with staff from Water Resources to provide updates on the Project that have occurred since the original Project Proposal submission to the Yukon Environmental and Socio-Economic Assessment Board (YESAB) in 2017.

BMC has a regularly scheduled monthly meeting with Energy Mines and Resources to discuss the QML application and issues arising in the review process. The Executive Council Office Major Projects group also participate in these meetings.

2.3.4 Community and Non-governmental Organizations

BMC has regular informal engagement with community groups and provides regular updates through its newsletters and media releases.

While there has not been formal engagement with non-governmental organization groups in recent months, BMC has regularly met with Yukon Conservation Society (YCS) over the past 7 years to provide updates on the Project and to receive informal feedback. BMC understands that YCS was the recipient of federal funding to participate in the YESAB process. Primary concerns raised during meetings with YCS since 2017 have included: the preservation of water quality, stability of the Class A and B Storage Facilities and financial securities for the Project.

These concerns have been addressed through updated designs of the liner and cover systems of the Class A and Class B Storage Facilities resulting in associated improvements in the water quality predictions at Closure. The stability of the facilities was addressed through appropriate engineering and design of the facilities, which includes removal of unsuitable overburden material from the foundation of the facilities, and completion of a formal Risk Assessment in 2024 including participation from YG and YCS. The financial security costs have been updated (Section 9) and will be progressively updated every two years as Mine development advances.

2.3.5 Future Engagement

Future engagement will follow BMC's Consultation and Engagement Plan as referenced above.

As well, in addition to the EMAC described in Section 2.3.1, under the proposed SEPA BMC has also committed to formation of a Management Oversight Committee and a Heritage Management Committee comprised of Kaska and BMC membership. In addition, under the RRDC Elders Conditions of Consent, BMC has committed to funding and using Kaska Land Guardians as part of the overall environmental management program for the Project.

The Decision Document for the Project also requires the formation of the joint Yukon Government/Kaska Finlayson Caribou Herd Oversight Committee (FCHOC). While BMC is not a member of the FCHOC it will be required to provide information and updated management plans to the Committee for review and opportunity for input.

All of these provide formal avenues for engagement with Kaska in addition to ongoing community engagement efforts.

2.4 CLOSURE ALTERNATIVES

Mine development and closure planning teams have worked together to evaluate a range of options for the measures which are most consequential to the successful design and closure of the Project. Mine waste storage alternatives (Sections 2.4.1, 2.4.2, and 2.4.3) were evaluated by the planning team, with a particular focus on designing for Closure. Waste cover alternatives (Section 2.4.4) were also evaluated by the planning teams.

2.4.1 Tailings Disposal Methods and Locations

Cominco, the previous owner of the Project, conducted exploration, engineering design studies, baseline environmental studies, and consultation activities in 1994 to 1995 to support planned Project development. The Cominco Mine plan included ABM open pit mining for a nine-year Mine life, storage of approximately 72 million tonnes of waste rock, with tailings deposited in a subaqueous valley-fill tailings storage facility, which included a permanent earth fill tailings storage facility in Geona Creek.

Knight Piésold Ltd. was retained by BMC to undertake a Tailings Management Alternatives Assessment (KP, 2016a) to support Mine design decisions for input to the Prefeasibility Design Report (KP, 2016b). BMC subsequently expanded the alternatives assessment to support the Project Proposal (BMC, 2017a), in which considerations for closure featured prominently in the evaluation. The alternatives assessment is summarized below.

The Knight Piésold Ltd. study identified 13 potential tailings storage sites within approximately 10 km of the ABM Deposit. Two methods of tailings technology for each site were considered: slurry and filtered tailings. The tailings technology for each candidate site was selected based on site-specific constraints.

Pre-screening criteria were developed to evaluate and eliminate candidates with evident shortcomings (KP, 2016a). The four candidates remaining after the pre-screening were:

- A. Slurry tailings storage facility located in Geona Creek;
- B. Slurry tailings storage facility located in the East Hanging Valley;
- C. Filtered “dry stack” tailings storage facility located near the current exploration camp, at the confluence of Geona and Finlayson Creeks; and
- D. Filtered “dry stack” tailings storage facility located on the western hillside of Geona Creek.

BMC then evaluated these four final candidate sites and types of deposition alternatives against common performance criteria. A filtered tailings storage facility located on the western slope in the upper valley of Geona Creek ranks as the preferred alternative for this component. A summary of the assessment is presented in Table 2-2.

Table 2-2: Summary of Alternatives for Tailings Disposal Methods and Storage Locations

Mine Component Alternatives	Performance Criteria				Overall Rating Against Performance Criteria
Tailings Disposal Methods and Locations	Cost Effectiveness	Minimizes Effects on the Natural Environment	Maximizes Socio-economic Benefits	Amenability to Reclamation	-
A. Slurry tailings in Geona Creek	Preferred	Least Preferred	Acceptable	Least Preferred	-
B. Slurry tailings in East Hanging Valley	Acceptable	Acceptable	Acceptable	Least Preferred	-
C. Filtered tailings at confluence of Geona and Finlayson Creeks	Acceptable	Acceptable	Acceptable	Acceptable	-
D. Filtered tailings "dry stack", western hillside, Geona Creek	Acceptable	Preferred	Acceptable	Preferred	Preferred Option

2.4.2 Waste Rock Storage Facility Locations Alternatives

Waste rock generated from mining the ABM open pit and the underground workings will be geochemically characterized into three distinct categories, based on their comparative acid rock drainage and/or metal leaching (ARD/ML) potential. While the locations for the Class A and B Storage Facilities were selected according to their geochemistry-driven operations and closure requirements, the alternatives for location of the benign Class C Storage Facility were assessed as follows:

- A. Southern Lakes Class C Waste Rock Storage Facility; and
- B. Geona Creek Valley Class C Waste Rock Storage Facility.

The deposition of Class C waste rock in the Geona Creek valley was ranked as the preferred alternative for this component. A summary of the assessment is presented in Table 2-3.

Table 2-3: Summary of Alternatives for Waste Rock Storage Facility Locations

Mine Component Alternatives	Performance Criteria				Overall Rating Against Performance Criteria
Waste Rock Storage Facility Locations	Cost Effectiveness	Minimizes Effects on the Natural Environment	Maximizes Socio-economic Benefits	Amenability to Reclamation	-
A. Southern Lakes Class C Waste Rock Storage Facility	Acceptable	Least Preferred	Acceptable	Acceptable	-
B. Geona Creek Valley Class C Waste Rock Storage Facility	Preferred	Preferred	Acceptable	Acceptable	Preferred Option

2.4.3 Waste Rock Management Alternatives

Waste rock storage facilities, described above, will be developed according to their comparative geochemical characteristics. There are essentially two management alternatives that could be employed for a portion of one or more of the facilities:

- Construct and operate permanent facilities utilizing progressive reclamation during mining operations; or
- Deposit rock temporarily and re-handle back into the ABM open pit at closure, noting that bulking will make it impossible to fit all waste rock back into the pit.

The two alternatives were assessed as follows:

- Permanent surface deposition of all waste rock; and
- Temporary surface storage of some waste rock (re-handling waste rock at Closure).

Permanent surface deposition of all waste rock with the integration of progressive reclamation was ranked as the preferred alternative for this component. While the second option presents an effective closure approach for the waste rock that can be submerged in the pit, it has a number of issues that need to be recognized:

1. It would not allow for progressive reclamation, effectively deferring implementation of closure of waste rock storage facilities until the end of mine life and increasing the closure liability for the Project;
2. The deferral of progressive reclamation will also negatively impact the quality of water from the Class A Storage Facility during Operations. Water and oxygen access to stored material would be significantly increased, increasing oxidation of sulphide minerals and subsequent release of COPIs, which would increase the closure liability for the Project; and
3. The open pit would not provide enough space to submerge all waste rock. This means that some waste rock would have to remain in the waste storage facilities, or would be placed above the water level in the pit area that forms the headwaters of Geona Creek.

Future improvement and optimization evaluations will likely include consideration of submerged in-pit storage of a portion of the waste rock.

Table 2-4: Summary of Alternatives for Waste Rock Management

Mine Component Alternatives	Performance Criteria				Overall Rating Against Performance Criteria
Waste Rock Management	Cost Effectiveness	Minimizes Effects on the Natural Environment	Maximizes Socio-economic Benefits	Amenability to Reclamation	-
A. Permanent surface deposition of all Waste Rock Storage Facilities	Preferred	Preferred	Acceptable	Acceptable	Preferred Option
B. Temporary surface storage (re-handling waste rock at closure)	Least Preferred	Acceptable	Acceptable	Preferred	-

2.4.4 Waste Cover Alternatives

The overall objective for the waste rock and tailings facilities for the Project at Closure is to have safe and stable facilities that have limited environmental effects (particularly for water quality) and to respect TLU (see Section 7.4 for more information on closure objectives for these facilities). The Project planning team has undertaken an extensive geochemical characterization program that has informed the design and operational management plans for these storage facilities to achieve this overall objective. The geochemical testing is discussed in the Acid Rock Drainage and Metal Leaching Characteristics of Materials for Kudz Ze Kayah Project (Ensero, 2023a) and the operational design considerations are discussed in the Feasibility Design Report (KP, 2019a), which is summarized herein. These designs, in turn, inform the measures that are required at closure to ensure environmental protection and appropriate end land use for the Project area.

The key water quality risk to address in base metal sulphide deposits is the generation of net acidity and the leaching of metals under near neutral or acidic conditions. The approach to the control of water quality in this context is a hierarchical one. That is, the preferred control will always be to prevent generation of the problem at the source, i.e. to prevent or minimize the generation of ARD/ML potential at the source (i.e., in the waste rock or tailings). The second level of control is to manage the migration of contact water into the receiving environment. This may not always be possible to control completely, and therefore a third level of control (collection and treatment of contact water) may be required. The selection of the control measures considers both the risks and the benefits of each.

Specific to meeting the closure objectives related to preventing or minimizing ARD/ML, the alternatives considered for waste rock and tailings covers included control of contact water by:

- Use of a locally sourced compacted glacial till liner and cover system (base case);
- Use of a composite glacial till and bituminous geomembrane liner and cover system;
- Use of a composite glacial till and a high-density polyethylene (HDPE) geomembrane liner and cover system

- Use of a composite glacial till and linear low-density polyethylene geomembrane liner and cover system; and
- Use of a composite glacial till and geosynthetic clay liner and cover system.

An assessment of each alternative was completed against criteria of constructability, effectiveness in reducing infiltration (low permeability), geotechnical stability and cost, as presented in Table 2-5, with a composite glacial till and a high-density polyethylene (HDPE) geomembrane liner and cover system selected as the preferred alternative for this component.

Table 2-5: Summary of Alternatives for Waste Cover Systems

Mine Component Alternatives	Performance Criteria				Overall Rating Against Performance Criteria
Waste Cover System	Constructability	Permeability	Stability	Cost	-
A. Glacial Till Liner	Acceptable	Least Preferred	Preferred	Preferred	-
B. Bituminous Geomembrane Liner	Acceptable	Preferred	Preferred	Least Preferred	
C. HDPE Liner	Preferred	Preferred	Preferred	Acceptable	Preferred Option
D. LLDPE Liner	Preferred	Preferred	Preferred	Acceptable	
E. Geosynthetic Clay Liner	Acceptable	Preferred	Least Preferred	Acceptable	

Details of the cover design for the Class A, Class B and Class C Storage Facilities are summarized as follows:

- Both the Class A waste rock and tailings material are anticipated to have strong ARD/ML potential and will be co-disposed in the Class A Storage Facility (Ensero, 2023a). Class A waste rock and tailings will be placed on a composite liner constructed from compacted glacial till and high-density polyethylene (HDPE) geomembrane. As far as is practicable, the majority of the facility (excluding an appropriately sized working face/area) will be progressively covered and reclaimed during Operations with a composite cover system, also constructed from compacted glacial till and an HDPE geomembrane. Once the Closure phase commences the composite cover system will be completed over the surface that remains to be covered and reclaimed. The cover will be overlain by a layer of Class C waste rock as a frost protection layer. Growth media will then be placed over this to allow surface revegetation. Additional detail is provided in the Tailings Management Plan (BMC, 2024a);
- Class B waste rock is anticipated to have ARD/ML potential over the longer term (after cessation of mining activities) and will be managed in the Class B Storage Facility (Ensero, 2023a). The design of this facility includes the same composite liner and cover systems as the Class A Storage Facility. The cover will be overlain by a layer of Class C waste rock as a frost protection layer. Growth media will then be placed over this to allow surface revegetation. Additional detail is provided in the Waste Rock and Overburden Management Plan (BMC, 2024b). Similar to the Class A Storage Facility, the Class B Storage Facility will be the subject of progressive reclamation during the Operations phase of the Mine;

- Class C waste rock is non-PAG and has low ML potential (Ensero, 2023a). Class C rock will be a source of rock for construction during Operations and for reclamation during Closure. This rock will be used, for example, for the frost protection layers on the Class A and Class B closure covers. Areas of the Class C Storage Facility that were not progressively reclaimed during Operations will receive a cover of growth media to promote revegetation at Closure. Additional detail is provided in the Waste Rock and Overburden Management Plan (BMC, 2024b); and
- Progressive reclamation will be carried out on three Waste Storage Facilities (Class A, B and C) over the life of the Project. This reclamation will commence with the construction of the base of the facilities with appropriate liners, internal roads, tipping points and bund walls being installed prior to and during mining commencement to facilitate easy management and reclamation. The bulk earthworks portion of the progressive reclamation will be carried out by the mining fleet as part of the normal cycle of work which will ensure that dumps are appropriately formed, covered and revegetated as they are built. This modern approach to Mine reclamation has been proven to be the most cost efficient, and also improves site aesthetics and helps to control dust around the Mine site. In addition to that, it means that cover and revegetation techniques can be effectively trialed and monitored in the field well before commencement of the Closure phases. At the point of closure of the Mine, minimal shaping of the three facilities will be required and the areas requiring final cover and revegetation will be minimized. This approach will significantly reduce the reclamation risk and cost of Mine closure after the Operations phase of the Project.

2.5 RECLAMATION RESEARCH

An important component of the reclamation planning process is ongoing research to support implementation of a successful reclamation program. Reclamation research is, and will continue to be, focused in areas related to both the key and contingency closure methods planned for the site, as well as the planned adaptive management measures, which include:

- Detailed engineering and field-testing during Operations of the cover for the waste rock and tailings storage facilities;
- Progressive reclamation of the waste rock and tailings storage facilities during the Operations phase of the Mine life in a manner complementary with the field testing regime;
- Revegetation and erosion control; and
- Semi-passive water treatment technologies.

These closure measures have been selected based on mining industry experience, experience of BMC's management on other Mine projects, and site-specific conditions. A reclamation research program has been designed to provide proof of concept, information to inform detailed design, and/or to optimize reclamation techniques for the Project. The elements of this program are presented in this section. Some aspects of site reclamation such as progressive recontouring and erosion stabilization techniques are well established and are less reliant upon site-specific research for success.

Information developed on site will be supplemented with information obtained from other Mine reclamation programs in Yukon and other jurisdictions. Considerable research has been carried out into the reclamation and revegetation of disturbed lands in Yukon and similar northern environments, including operating and abandoned mines, and mineral exploration sites. Much of this information is in the public domain and is well presented in the guidance documents Mine Reclamation Guidelines in the Northwest Territories (INAC, 2007), and Yukon Revegetation Manual, Practical Approaches and Methods (Matheus and Omtzigt, 2013). BMC personnel have communicated with members of the Faro Mine Remediation Project, where similar methods of reclamation are currently being researched and implemented, and intend to continue learning from this large and complex reclamation project.

Research results and any related revisions to planned closure measures will be provided in regular RCP updates.

2.5.1 Waste Cover Systems

Composite cover systems are planned for the Class A and Class B Storage Facilities for long-term chemical stability. As discussed in more detail in Chapter 7 of the RCP, the Class A Storage Facility will employ a cover comprising the following:

- Approximately 0.50 m layer of compacted glacial till;
- Overlain by an 80 mil textured HDPE geomembrane;
- Overlain by approximately 0.50 m protection layer;
- Overlain by a minimum of 3.0 m of Class C waste rock for frost protection; and
- A final layer of approximately 0.30 m of growth media for revegetation.

The cover will be constructed progressively during Operations as the facility is expanded.

The Class B Storage Facility will receive the same cover system as the Class A Storage Facility. That is approximately 0.50 m layer of compacted glacial till overlain by an 80 mil textured HDPE geomembrane overlain by approximately 0.50 m protective layer that will be covered by a minimum of 3.0 m of Class C waste rock for frost protection, and approximately 0.30 m of growth media for revegetation. This cover system will be progressively constructed during Operations and completed during Active Closure.

The Class C Storage Facility does not require control for long-term chemical stability; the facility will be progressively reclaimed with approximately 0.30 m of growth media for revegetation during Operations and Active Closure.

The following tasks are underway or are planned during the life of Mine to finalize the cover designs and predict performance. Progressive reclamation will allow for waste cover system performance to be evaluated and revised as necessary during Operations.

- Cover material characterization including field confirmation of material quantities and properties to achieve the design cover performance of the compacted till layer;
- Updating geochemical modelling during operations to inform detailed design of the cover systems;
- Geotechnical material characterization of glacial till material to be used in the cover systems;
- A program to determine frost penetration depth line at the waste storage facilities. This will include collection of data from installed temperature (thermistor) and moisture (conductivity) sensor(s) to create a profile in the top 6.0 m below ground surface to determine depth and seasonal freeze/thaw pattern;
- Predictive modelling of cover performance during detailed design including climate, storage facility slopes and aspect, and testing of borrow materials to determine realistic short-term and long-term performance of Class A and Class B Storage Facility covers;
- Evaluation of options for performance monitoring, such as equipment to measure water ingress through the cover material and the temperature profile of the frost protection cover during progressive reclamation, to monitor and assess the covers during Operations, and Closure; and
- The Class A, Class B and Class C facilities require a growth media to provide appropriate substrate for revegetation and are designed to be covered with approximately 0.30 m of growth media based on typical rooting depths. The rooting depth will be checked during re-vegetation plot trials to determine if the planned 0.30 m can be reduced or needs to be augmented.

2.5.2 Revegetation

Successful and appropriate revegetation is a vital component of Mine closure and, as such, revegetation research is being undertaken by BMC in collaboration with Kaska to establish the best approach to regenerate vegetation covers on disturbed areas (Appendix B).

The ongoing revegetation research program includes (or is planned to include):

- Optimization of the revegetation species mixes, integrating TK for the area with Yukon revegetation guidance and commercially available native species;
- Collection of seeds and cuttings sourced from the Project site to carry out research to optimize species mixes, and germination and propagation techniques in a nursery, likely either in Ross River or at site;
- Preparation, seeding, planting, fertilizing, management, and monitoring research test plots on site; and
- Implementation and evaluation of progressive reclamation during Operations and Active Closure.

Plants require, as a minimum, a medium that will allow roots to penetrate, that will retain adequate moisture and that contains suitable levels of nutrients for successful growth. The natural vegetation found on undisturbed areas around the Project site generally provides information about the underlying soil properties required for successful revegetation, including texture, drainage, and pH, and the level of available nutrients. A soil sampling program was initially conducted in the Project site in 2015 and 2016. The results of this program provide the basic information required for reclamation planning.

Two research plots were established at the Project site (Appendix B) in 2018 and will be monitored for the duration of the Project. Additional reclamation research trial plots will be constructed during Operations to collect site-specific data to aid with the final reclamation treatments. Trial plots will be constructed after the first few years of operation, when there is sufficient material to evaluate the physical properties of the different storage facilities. The main disturbance areas that will be the focus for the research trials are the Class A, Class B, and Class C Storage Facilities as well as an area of unaffected surface disturbance as a control.

Probable initial trial sites during Operations will include the initial lifts on the Class A, B and C Storage Facilities. Trials will be constructed on flat and sloped surfaces for each disturbance area, as the closure goal will be to reclaim areas with varying surface slopes. Each trial site will examine a combination of different revegetation treatments to help outline the most effective and efficient closure treatment for the areas requiring reclamation.

Treatment options at sites will depend on the reclamation objectives for each reclamation unit, and may include:

- Plant species and seed ratios;
- Native seed and naturalized seed mix variations;
- Reseeding requirements;
- Willow staking;
- Scrub birch seedling planting and protection requirements;
- Soil and fertilizer amendment types and application rates; and
- Surface treatment and seeding and amendment application techniques.

Treatments at each trial site are divided into four subplots and assigned and replicated in each trial to ensure data is accurately representing the treatment variation. Analysis of the effect of each treatment option will be used to inform the final reclamation prescriptions.

A Terrestrial Ecosystem Map was developed to define and quantify specific habitat types in the bioclimatic zones of the vegetation in the Project area (AEG, 2016a). Plant species selection will be based on the Terrestrial Ecosystem Map vegetation associations and the appropriate edatopic grid (based on soil moisture and nutrient regime). More detail on the reclamation revegetation program at the Project site is presented in Section 7.1.2.

Trial plots will be monitored to compare relative percent cover, species composition, and height with respect to the seeding treatment and previous monitoring results. It is expected that for the first two to three years, individual species might not be distinguishable in the field and therefore only measurements such as percentage cover and height will be recorded. Additionally, composite soil samples and tissue samples will be periodically collected from trial sites and examined for metal concentrations to monitor the relative amount of metal uptake occurring at each site in comparison to the control site. Growth and succession will be recorded and reported annually, and modifications made to the progressive revegetation program as required. Design of the research program will take into consideration the results of Yukon University research initiatives where there are related programs. One specific area of research Yukon University has undertaken relates to soil amendments and their potential to assist with germination, nitrogen-fixing and the development of biological soil crusts, which may in turn improve seed germination and establishment of diverse vegetation communities. Research at the Project site will include homogenizing native soil crusts (i.e., the lichens, bryophytes, and topsoil layer) and applying the soil mix to reclamation trial plots. Soil amendment methods will be developed with the consideration of methods demonstrated to be successful in the Yukon College (now Yukon University) research by Stewart (2013), when reasonable and applicable.

In addition to the site specific reclamation research, BMC has contributed funds to RRDC's Local Plant Nursery Feasibility Study. BMC is supportive of a Kaska owned and operated local plant nursery/greenhouse. Using local species can have many advantages over non-native species as previously disturbed sites have a better chance of being restored to their pre-disturbance condition. In addition to environmental benefits, a nursery envisions many socio-economic advantages including:

- Employment and economic opportunities;
- Building human resources, relationships and expertise with local community; and
- Connect communities through engagement and new opportunities.

BMC would not only purchase seeds and seedlings from the Kaska owned nursery but would also source Kaska staff to come to the Project to collect the seeds and participate in the reclamation activities. Seed collection training programs were developed in 2020 in collaboration with Yukon University and Dena Cho. For a nursery project to be economically viable there needs to be a major anchor client such as the KZK Project. BMC will work with RRDC to advance the nursery project once all licences are in place for the Project.

BMC supported the Yukon University Mine Research Committee's revegetation research programs and is actively looking to support additional mine revegetation research through both the Yukon University and the University of Saskatoon.

As the Project progresses BMC is committed to ongoing engagement and collaboration with Kaska to further refine and implement the revegetation programs, including seeking advice on species of cultural importance that should be included in studies and research. Through this collaboration, the risk of traditional land users of avoiding the Project area in Post-Closure will be reduced.

2.5.3 ABM Lake In Situ Water Treatment

Following the cessation of Operations, the Fault Creek diversion (Section 7.2) will be removed, which will allow Fault Creek to return to its pre-mining channel and begin filling the ABM open pit, ultimately creating the ABM lake. Approximately 15 years after the cessation of mining, the ABM lake is predicted to overtop and discharge to Geona Creek (KP, 2024a). Water quality modelling of the ABM lake chemistry suggests that without treatment concentrations of cadmium, copper, lead, selenium, uranium, and zinc will be present at levels that exceed water quality objectives (WQOs) and will require treatment prior to discharge (Ensero, 2024; Ensero and Minnow, 2024). Therefore, source control for the ABM lake is planned in the form of in situ treatment.

The planned in situ treatment involves injection of a calculated amount of soluble organic carbon (e.g., glycerol) into ABM lake, which stimulates indigenous bacteria to produce sulphate-reducing conditions in the water column. The dissolved sulphide produced under such conditions will react with chalcophile metals (elements with an affinity for forming metal sulphides) such as cadmium, copper, lead and zinc to form insoluble metal sulphide precipitates. The reducing conditions will also promote the reductive precipitation of selenium and uranium (e.g., as uraninite and elemental selenium).

In situ water treatment has been successfully employed at other cold climate sites in North America to significantly lower metal concentrations [e.g., Sweetwater, Wyoming (Harrington, 2002); Barite Hill, South Carolina (Harrington et al., 2009); and Anchor Hill, South Dakota (Harrington et al., 2004)]. The planned treatment requires refinement and proof-of-concept testing using local materials (e.g. ABM waste rock, local soil) and representative water chemistry to refine the treatment application methods, materials, and dosage quantities. Ensero (formerly Alexco Environmental Group) was retained to conduct pilot-scale tests to validate the site-specific application of in situ treatment, and to further refine the treatment materials and dosages (Appendix C). Pilot-scale testing consisted of eight 200 L plastic barrels each containing 10 kg of composite waste rock and 200 L of synthetic ABM lake water. Trials differed in the amount of soil amendment added (10 g vs. 10 kg), constituents of potential interest (COPI) concentrations (water quality model inputs vs. 10 times the water quality model inputs), carbon dosing (regular or high) and temperature (room temperature or 5°C).

The objectives of the pilot-scale tests were to:

- Demonstrate that in situ treatment is capable of lowering the COPI concentrations in ABM lake;
- Confirm that the degree of constituent removal observed in the testing is consistent with that assumed in the water quality modelling for ABM lake in situ treatment;
- Obtain information on the appropriate carbon dosage for ABM lake in situ treatment; and
- Assess the longevity of in situ treatment events to provide information on the likely required frequency of carbon amendment to ABM lake in the early years of closure.

Pilot-scale test work was performed to evaluate the organic carbon dosage and the effects of soil amendment and temperature on the efficacy of the planned in situ water treatment. This included

eight trials which were performed using 200 L barrels containing synthetic water designed to replicate the modelled chemistry of ABM lake, amended with crushed waste rock reflecting the final exposed open pit surfaces. Stage 1 of the test work operated for 34 weeks; during which glycerol was added to the trials to assess COPI removal under reducing conditions. The results from Stage 1 test work indicated that:

- Organic carbon amendment (as glycerol) of synthetic ABM lake water resulted in the development of sulphate-reducing conditions which in turn resulted in reduction of antimony, cadmium, copper, lead, selenium, uranium, and zinc concentrations
- The addition of 10 kg of local soil to selected trials resulted in COPI treatment results comparable to those trials that received only a small soil inoculum dose of local soil (10 g), however, following re-oxidation, sustained COPI concentration reduction via sorption on the larger soil mass was observed for these experiments;
- At lower temperatures (5°C), reducing conditions were slower to be established, due to slower microbial metabolism at the colder temperatures, which was reflected in the slower decrease of COPIs compared to those trials operating at room temperature;
- The level of COPI removal assumed in the ABM lake water quality model (Ensero, 2024) was confirmed by the in situ treatment trial; and
- The in situ trials demonstrated establishment of a diverse population of sulphide-producing, selenium-reducing, and uranium-reducing bacteria with the addition of carbon, thereby supporting the observation of microbially catalyzed COPI removal in the trials. Establishment of the bacteria was not inhibited by colder temperature or by higher COPI concentrations that were also tested.

As expected, arsenic removal was not observed under the reducing conditions during Stage 1. Therefore, ferric iron dosing was investigated in Stage 2 of the in situ treatment trials over a 12 week period. Ferric sulphate was added using 10:1 and 20:1 iron to arsenic ratios (by mass) to the pilot-scale barrel trials, both before or after carbon addition, to evaluate arsenic removal in the presence of elevated iron under both oxidizing and reducing conditions. These experiments indicated:

- Addition of ferric iron resulted in a maximum removal of approximately 40% to 65% of dissolved arsenic from the water;
- The higher iron to arsenic ratio (20:1) improved removal of dissolved arsenic, suggesting that overall removal of total arsenic may be further improved with an extended settling time;
- Lower temperature did not affect the overall arsenic removal observed;
- Although the order of ferric and carbon dosing did not appear to influence the maximum total arsenic removal observed, greater removal of dissolved arsenic was observed when ferric iron was first added under oxidizing conditions prior to the transition to reducing conditions after carbon amendment;
- Additional arsenic sequestration in reducing systems likely occurs via incorporation into iron sulphides in the presence of iron, which can also polish arsenic concentrations as the system

begins to re-oxidize, perhaps through sorption on iron (oxyhydr)oxides that start to re-precipitate; and

- Ferric iron addition under oxidizing conditions resulted in no to minor reduction of other COPIs; however, subsequent transition to reducing conditions resulted in improved reduction of cadmium and copper at the highest iron dose.

Given the lower than expected arsenic removal observed, smaller bench-scale (Stage 3) trials were conducted using 1.5 L of synthetic ABM lake water amended with ferric iron at 10:1 and 20:1 iron to arsenic ratios (by mass). These trials were sampled over seven days and showed 50% and 90% total arsenic removal for the 10:1 and 20:1 iron to arsenic ratio experiments, respectively. Improved mixing in these bench-scale trials likely explains the higher arsenic removal observed than in the larger pilot-scale barrel trials.

Based on the pilot-scale test work, ferric iron addition is considered a contingency should arsenic levels measured during filling of ABM pit require treatment. Similarly, addition of soil material to aid COPI removal via sorption or placement of Class C waste rock in ABM pit to provide acid neutralization may also be considered as contingency options if required.

Additional research to take place during Operations will include studies to collect supporting information for in situ water treatment including hydrodynamic pit lake modelling which incorporates water balance updates informed by site data (precipitation, climate change, ABM pit shell, groundwater, local runoff etc.).

ABM lake is expected to take approximately 15 years to fill before it begins to discharge to Geona Creek. Water quality monitoring of the ABM lake will occur as it fills so as to monitor its chemistry, to help direct the optimal location and timing of in situ treatment, and to determine whether additional treatment events are required to maintain low COPI concentrations that are expected to peak in the first year of flooding as the more reactive, metal-leaching rock facies are located in the lower portion of the ABM pit which release their accumulated soluble load to the small volume of water in the pit. COPI concentrations are then anticipated to decline over the following year due to dilution before stabilizing or rising slowly as the pit fills.

2.5.4 Constructed Wetland Treatment Systems

Contingency measures, if the objectives for ABM lake treatment are not met, include a constructed wetland treatment system (CWTS). Water quality modelling indicates that water quality in the receiving environment will typically meet the water quality objectives without further treatment (Ensero, 2024; AEG & Minnow, 2024); however, the CWTS continues to be tested and optimized as it may function to further improve water quality, although is not needed or intended as a primary treatment mechanism.

Following an initial evaluation of the feasibility of implementing a CWTS at the Project site, a phased approach to design the CWTS was implemented in 2015 and Contango Strategies Ltd. (Contango), was retained to undertake the phased design. The planned approach includes five phases of design and implementation of a CWTS including:

- Phase 1a: Information gathering and site assessment;
- Phase 1b: Conceptual design and sizing;
- Phase 2: Off site bench-scale testing and optimization;
- Phase 3: Off site pilot-scale testing and optimization;
- Phase 4: On site demonstration-scale design and monitoring; and
- Phase 5: Full-scale implementation.

Information gathering and site assessment (Phase 1a) was completed in 2016 (Contango, 2016). Conceptual design and sizing was completed in 2017 (Contango, 2017). Off site bench and pilot scale test work was initiated in 2018. Details of the Phase 2 and 3 test work completed to date are provided in Appendix D. The objectives of the off site bench and pilot scale CWTS test work are to refine the sizing of the full scale CWTS and the expected CWTS outflow water quality in the event that the CWTS is needed. Phase 4 will be conducted during Operations.

2.5.4.1 Contingency

Condition #4 of the Decision Document issued on June 15th, 2022, requires that: *“The Proponent shall implement additional treatment options if the proposed CWTS cannot be demonstrated to reduce COPI concentrations to levels that are consistently below the defined regulatory thresholds.”* As described above the CWTS has become a contingency measure to the Project at closure. However, if water quality monitoring shows that this contingency measure is not achieving the intended outcome, then additional treatment options would be implemented.

3 CLOSURE OBJECTIVES AND DESIGN CRITERIA

Section 2.1 identified the framework and process used to develop “on the ground” closure measures that can be demonstrably linked back to the closure goals for the site. The broader closure goals are broken down into a number of objectives, the attainment of which through specific measures will indicate achievement of closure goals. Closure objectives are statements that clearly describe what the selected closure measures aim to achieve. They must be achievable and must allow for the development of measurable closure criteria. Objectives are short-term, concrete, stepping-stones toward achieving a goal and should be specific, appropriate and realistic. The purpose of implementing performance-based objectives is to encourage research and innovation resulting in cost-effective applications while ensuring public health and safety and environmental protection are met (YG, 2013).

3.1 RECLAMATION AND CLOSURE OBJECTIVES

The development of the reclamation and closure objectives for the Project start with the fundamental objectives established in YG, 2013 (Table 3-1).

These fundamental objectives form the basis for the development of Project-specific and component/facility specific objectives for the Project in Post-closure. These are presented in Chapter 7.

Table 3-1: Fundamental Mine Reclamation and Closure Objectives (YG, 2013)

Value	Reclamation and Closure Objectives
Physical Stability	All Mine-related structures and facilities are physically stable and performing in accordance with designs. All Mine-related structures, facilities and processes can withstand severe climatic and seismic events.
Chemical Stability	Release of contaminants from Mine related waste materials occurs at rates that do not cause unacceptable exposure in the receiving environment.
Health and Safety	Reclamation eliminates or minimizes existing hazards to the health and safety of the public, workers and area wildlife by achieving conditions similar to local area features. Reclamation and closure implementation avoids or minimizes adverse health and safety effects on the public, workers and wildlife.
Ecological Conditions and Sustainability	Reclamation and closure activities protect the aquatic, terrestrial and atmospheric environments from Mine-related degradation and restore environments that have been degraded by Mine-related activities. The Mine supports a self-sustaining biological community that achieves land use objectives.
Land Use	Lands affected by Mine-related activities (e.g., building sites, chemical and fuel storage sites, roads, sediment ponds, tailings storage facilities, and waste rock storage areas) are restored to conditions that enable and optimize productive long-term use of land. Conditions are typical of surrounding areas or provide for other land uses that meet community expectations. Site access is consistent with community land use expectations.
Aesthetics	Restoration outcomes are visually acceptable.
Socio-economic Expectations	Reclamation and closure implementation avoids or minimizes adverse socio-economic effects on local and Yukon communities, while maximizing socio-economic benefits. Reclamation and closure activities achieve outcomes that meet community and regulatory expectations.
Long-term Certainty	Minimize the need for long-term operations, maintenance and monitoring after reclamation activities are complete.
Financial Considerations	Minimize outstanding liability and risks after reclamation activities are complete.

3.2 DESIGN CRITERIA

A key principle in the reclamation planning for the Project is design for closure. Success in applying this principle to the closure planning in turn supports other principles and fundamental closure objectives related to minimizing activities required at closure and reducing associated risks and liabilities.

Specific design criteria related to Project closure and Mine components (i.e. ABM open pit, waste rock storage facilities, etc.) are presented in Section 7. These criteria have largely been developed by the Project engineering team and presented in the Feasibility Design of Tailings Waste and Water Management Facilities report (KP, 2019a).

4 ENVIRONMENTAL DESCRIPTION

4.1 REGIONAL SETTING

The Project is located in the Boreal Cordillera Ecozone, situated in a transitional climatic zone bordering on three different ecoregions: Yukon Plateau to the north, Liard Basin to the east, and Pelly Mountains ecoregion to the south (Smith et al., 2004). The Project footprint is in the northern portion of the Pelly Mountains ecoregion (Figure 4-1). The major part of the Pelly River ecoregion is underlain by metamorphic rock; however, large bodies of volcanic and intrusive rocks and small bodies of sedimentary rocks occur throughout.

The planned Project infrastructure is primarily situated from an elevation of 1,300 masl to approximately 1,550 masl (Figure 4-2).

The Project is situated in the upper Geona Creek valley, which is surrounded by larger steeper sided mountain slopes. A series of shallow wetlands occur along Geona Creek due to historical beaver dams in the valley bottom. Side valleys east of the Geona Creek valley are relatively broad and 'U-shaped'. Tributaries, such as Fault Creek, are high velocity streams that have incised the mountain slopes before depositing sediment into Geona Creek.

At higher elevations, dwarf shrubs, graminoids, and herbs dominate; boreal forests are more prevalent at lower elevations. White spruce (*Picea glauca*) and black spruce (*Picea mariana*) are the most common tree types. Black spruce is usually dominant in wetter areas, while white spruce dominates in drier areas. Paper birch (*Betula papyrifera*), trembling aspen (*Populus tremuloides*), balsam poplar (*Populus balsamifera*), and lodgepole pine (*Pinus contorta*) also occur; sub-alpine fir (*Abies lasiocarpa*) occurs at the treeline (1,350 masl to 1,500 masl). In dense coniferous stands, feathermoss dominates the understorey; however, in more open areas willow (*Salix* spp.) and heath-like shrubs become prevalent. Sedge or sphagnum tussocks are common in wetlands and under black spruce. Scrub birch (*Betula glandulosa*) and willow occur in the subalpine and extend well above the treeline.

The Project area is in the "Extensive Discontinuous Permafrost Zone". Permafrost has been encountered under the organic layers that cover the Geona and Finlayson valleys. Permafrost is typically located under poorly drained areas, cool aspects, and upper elevations. Permafrost related ground movement or solifluction is apparent on upper to middle elevation slopes.

Regionally significant wildlife resources occur in the Project area. The area surrounding the Project forms part of the extensive regional habitat used by the Finlayson caribou herd from spring to fall, while the Pelly River lowlands are part of the area used by the herd in the winter. Caribou (*Rangifer tarandus*) provide a valuable food source for the Kaska and are also of economic significance to sport hunters and the guiding industry. Moose (*Alces alces*) are also a significant wildlife resource and are found in all habitats (except alpine habitat) throughout the Project area. Furbearer populations are also prevalent. Waterfowl use the wetlands in the upper Geona Creek valley for nesting and foraging. Cliff-nesting raptors nest on rock outcrops and many species of songbirds utilize the various habitats throughout the area. Fish in the Liard River watershed include Arctic grayling (*Thymallus arcticus*), whitefish (*Coregonus clupeaformis*), lake trout (*Salvelinus namaycush*), and Dolly Varden (*Salvelinus malma*).

4.2 CLIMATE

The climate of the Project is described using regional data available through Environment and Climate Change Canada and Environment Yukon, as well as data collected at site in 1995 and from 2015 to March 2023 (Ensero, 2023b). Two meteorological stations were established in the Project area during 1995; one high and one low elevation station. A Campbell Scientific meteorological station was installed and commissioned at the Project site on August 25, 2015, for the measurement of air temperature, relative humidity, wind speed and direction, barometric pressure, solar radiation and total precipitation. An evaporation pan was also installed, and daily manual measurements were taken during the open water seasons of 2016 and 2017. The evaporation pan had an automated system installed in June 2018. Manual snow surveys were conducted in 1995, and monthly (January, February, March and April) from 2016 to 2019 and in March from 2020 to 2023.

The Project area has a typical northern interior climate, with cool and short summers and long and very cold winters. The mean annual temperatures at regional stations ranged from -4.7°C at Ross River to -2.2°C at Swift River Station, and extreme annual temperatures ranged from -59.4°C at Ross River in December to 35.4°C at Watson Lake in July.

Monthly average minimum, maximum, mean and extreme temperatures are compiled from the hourly data collected at the Project's Campbell Scientific station since time of commissioning (September 2015). The mean annual temperature recorded at Kudz Ze Kayah has ranged from -0.8°C to -3.6°C.

Mean annual precipitation at regional stations ranged from 210 mm at Ross River to 710 mm at Ketza River Mine; the proportion of total annual precipitation falling as rain ranged from 39% at Ketza River Mine up to 70% at Ross River and Faro. The greatest amount of precipitation generally falls between June and September for all regional stations.

Long-term records do not show clear trends in terms of total precipitation over time; however, the proportion of total precipitation falling as rain has displayed an increasing trend at all stations, consistent with the rising trends observed in air temperature. Total annual measured precipitation at Kudz Ze Kayah between 2016 and 2022 ranged from 217.7 mm to 333.4 mm, noting that 2017 and 2018 had missing data and their annual totals were not considered.

4.3 SURFACE WATER

4.3.1 Water Quantity

The Project lies in a small watershed called Geona Creek, which is a north flowing and north facing tributary to Finlayson Creek (Figure 4-3). Finlayson Creek meets the outflow of Finlayson Lake below the Robert Campbell Highway and flows east to eventually join the Frances River, and ultimately, the Mackenzie River. One of the highest elevation tributaries in Geona Creek is Fault Creek, which has a median elevation of 1,708 masl, and a catchment area of approximately 2 km². Fault Creek is characterized by steep slopes, and small trees and shrubs in the creek valley, but otherwise is an alpine environment. Geona Creek has a median elevation of 1,479 masl and spans from the alpine to sparsely forested areas at lower elevations. The Finlayson Creek catchment area is approximately 35 km² above the confluence with Geona Creek and grows to 211 km² where it flows under the Robert Campbell Highway shortly before it joins the outflow of Finlayson Lake. The watershed divide of Geona Creek is characterized by several small ponds.

Hydrometric data were first collected on site in 1995. Seven continuous monitoring stations were installed in May 2015 and discrete monthly discharge data were gathered to facilitate the development of a continuous record. The current monitoring network consists of 12 active stations (one station was discontinued in March 2017).

The hydrometric data collected between 2015 and 2023 indicate that peak flows typically occur in May in the smaller catchments, though they can occur in summer months in years when snow melt generated peak flows are less significant. Low flows occur late winter in March, April or even early May depending on the melt cycles and snowpack in any given year. None of the creeks have been observed to freeze completely and some flow has been observed in all months of the 2015 through 2023 monitoring program. Smaller catchments tend to peak earlier than large regional rivers. It was also observed that higher flows in September are likely driven by precipitation, which has a greater relative impact in small creeks than larger rivers as the large regional sites tend to dampen the effect of more localized rain events (Ensero, 2023b).

4.3.2 Water Quality

The surface water monitoring program currently consists of monthly water quality sampling at twelve surface water stations located on South Creek, Fault Creek, Geona Creek, Finlayson Creek, and East Creek. The most recent baseline report (Ensero, 2023c) presents the data collected between April 2015 and March 2023. These data were combined with the historic Cominco water quality surveys conducted in 1994 to 1995 and subsequent biennial sampling, as required by the water licence, conducted between 2002 and 2016 to evaluate the natural background chemistry of the major watercourses located at the Project. All creek waters were circumneutral to mildly alkaline (pH 6.4 to 8.7; median 7.7), with hardness ranging from moderately hard (South Creek and Fault Creek) to hard (Geona Creek) to very hard (Finlayson Creek and East Creek).

FIGURE 4-3

REV
D

D	03DEC19	ISSUED WITH REPORT	WOG	SBF	GLS
REV	DATE	DESCRIPTION	DESIGNED	DRAWN	REVIEWED

Water quality was compared against the most recently revised water quality guidelines for protection of aquatic life established by the Canadian Council of Ministers of the Environment (CCME) or British Columbia Ministry of Environment and Climate Change Strategy (BC ENV). Comparison to the guidelines indicated sporadic natural exceedances for dissolved oxygen, fluoride, phosphorus, aluminum, arsenic, cadmium, chromium, copper, iron, selenium, and zinc. In general, more water quality guideline exceedances were noted for total metal concentrations than their dissolved counterparts, suggesting that a significant portion of the metals were particulate-bound, especially during freshet and/or other periods characterized by elevated total suspended solids levels. The much less frequent water quality guideline exceedances observed for dissolved metals is important since it is the dissolved fraction that is the most bioavailable.

Higher total metal concentrations were measured during spring freshet due to the high run-off and associated stream flow which increased the particulate content of the streams. The exceptions to this trend were concentrations of fluoride, total selenium, uranium, and hardness, which were lowest during spring freshet and summer. Selenium, uranium, and hardness concentrations rose throughout the late fall and winter months, suggesting that groundwater is an important contributor to the surface water concentrations of these constituents. Elevated concentrations of these constituents were observed in shallow groundwaters of the Project area.

A comparison of the 1994-1995 water quality dataset with the more recent baseline water quality monitoring dataset indicated that the majority of constituents shared a similar concentration range. This suggests that for the most part there were no material differences between the two datasets, the exceptions being total selenium and total chromium, which may be attributable to differences in sampling frequency, flow conditions at the time of sampling, and laboratory pre-concentration techniques used to improve the detection limits of these two elements in the historical dataset (Ensero, 2023c).

4.4 GROUNDWATER

4.4.1 Groundwater Quantity

The hydrogeologic units in the Project area are bedrock and overburden (Ensero, 2023d). The overburden consists of two subunits:

- Fine-grained lower permeability sediments composed of silts and fine sands; and
- Coarse-grained higher permeability sands and gravels.

In the depth range of 10 m to 70 m below ground surface, the bedrock hydraulic conductivity generally ranges from 1×10^{-7} m/s to 1×10^{-5} m/s and does not appear to exhibit a trend of increasing or decreasing hydraulic conductivity with depth. The geometric mean of short-term tests conducted in bedrock is 1.2×10^{-6} m/s, which is similar to the results of a longer-term bedrock pumping test (1.7×10^{-6} m/s).

For tests conducted in the fine-grained overburden, the measured hydraulic conductivities have a geometric mean of 5.2×10^{-6} m/s. The geometric mean hydraulic conductivity of the coarse-grained overburden is 1.3×10^{-4} m/s.

Continuous groundwater level monitoring was conducted in eight monitoring wells across the site from mid-November 2015 through March 2023. The water levels in both bedrock and overburden wells exhibited the following seasonal trends:

- Rising water levels through the summer months (late April/early May to September);
- Peak water levels reached between June to August to October, depending on the year;
- Falling water levels through the winter months (approximately October to April); and
- Lowest levels reached between April or May, depending on the year.

In most monitoring wells, the maximum-minimum water level difference ranged between 2 m and 8 m; the maximum observed difference was 16.5 m.

4.4.2 Groundwater Quality

Project wide, the groundwater field pH ranged from circumneutral to slightly acidic to alkaline (5.7 to 9.4, for both bedrock and overburden wells (Ensero, 2023d)). Monitoring wells MW15-10S and MW15-10D had the lowest pH values compared to the average field pH (5.8 to 6.5, and 5.8 to 7.4 pH range, respectively) and are likely recharged by the same source as the KZ-9 east seep.

Water quality results were compared against the Yukon *Contaminated Sites Regulation* (YG, 2002) standards, which indicated exceedances for dissolved cadmium, arsenic, cobalt, and zinc. Dissolved iron concentrations were also higher than federal interim groundwater quality guidelines in several wells (often bedrock wells) across the site partly due to the reducing conditions prevailing at those wells. Concentrations of other anions, nutrients, and metals did not typically show marked differences between overburden and bedrock aquifers. In general, dissolved selenium concentrations were higher in shallower overburden wells but no clear pattern was evident for other constituents.

Groundwater sampled in the planned ABM open pit area had generally higher anion, nutrient, and metal concentrations than groundwater sampled elsewhere in the study area. Groundwater concentrations of arsenic, cadmium, copper, lead, and zinc were elevated in the planned ABM open pit area relative to the rest of the study area, which is likely due to the subsurface mineralization present in this area. Additionally, sulphate concentrations were typically more elevated within the planned ABM open pit area, likely due to the oxidation of the sulphidic minerals in the ABM Deposit.

4.5 VEGETATION

4.5.1 Terrestrial Ecosystems

A Terrestrial Ecosystem Map was developed to define and quantify specific habitat types in the bioclimatic zones of the vegetation in the Project area (AEG, 2016a). From this mapping three bioclimatic zones were identified (Boreal High (40%), Boreal Subalpine (40%), and Alpine (20%)).

Boreal forest ecosystems are gradually replaced by the subalpine plant communities as elevation increases. This is commonly a matrix of scrub birch and willows with an occasional stunted subalpine fir. Meadows also occur in the subalpine zone, populated by grasses, sedges, mosses, and a variety of forb species. On the top of mossy hummocks, the dwarf ericaceous shrubs persist, and Labrador tea exists. The lower and mid slopes of the subalpine valleys contain sparse subalpine fir and white spruce forests.

The Alpine bioclimatic zone is characterized by limited soil and harsh climatic conditions. Therefore, small, low-growing plants such as sedges, grasses, forbs, and dwarf shrubs persist at alpine elevations. Dwarf shrubs are an assemblage of ericaceous plants consisting of four-angled mountain heather (*Cassiope tetragona*), bog blueberry (*Vaccinium uliginosum*), lingonberry (*Vaccinium vitis-idaea*), crowberry (*Empetrum nigrum*), and bearberry (*Arctostaphylos rubra*). Other low growing shrubs that were often observed at these high elevations included: mountain aven (*Dryas integrifolia*), willow species (*Salix arctica*, *reticulata*, and *polaris*), and diminutive scrub birch.

A total of 27 vegetation communities were defined and are described in Appendix A of the Baseline Vegetation Report (AEG, 2016a). The Project area and associated infrastructure is primarily situated in the subalpine bioclimatic zone, from an elevation of 1,300 masl to approximately 1,550 masl, with the open pit anticipated to extend to the lower range of the alpine zone. Table 4-1 is a summary of the vegetation communities that are found within the proposed Project infrastructure. The Project infrastructure will affect most of the vegetation communities with the following communities being the most impacted in area by the proposed facilities: Subalpine – Scrub birch-Willow-Feathermoss (01) including the fir association (01SZ), Subalpine – Scrub birch-Willow-Crowberry (23) and Subalpine – Scrub birch-Lichen (11) (Table 4-1).

The riparian systems in the Project area are composed of two types: slow flowing creek/fen complexes with associated wetlands, or faster flowing creeks confined to deep valleys with definitive floodplains, such as Finlayson Creek. The riparian systems associated with slow flowing creeks contain organic substrates derived from sphagnum mosses and graminoids. Acid tolerant plants such as Labrador tea, bog blueberry, and cloudberry (*Rubus chamaemorus*) grow amongst the moss hummocks. The second type of riparian system has a rocky substrate; comprising sediment composed mostly of gravel, cobbles and boulders. The vegetation associated with this system is tall willows, balsam poplar, and white spruce on upper terraces.

4.5.2 Rare Plants

The Yukon Conservation Data Centre (YCDC) compiles lists of plants that are of global concern, federally listed under the *Species at Risk Act*, or of specific conservation concern in the Yukon. The YCDC publishes a Track list, which is publicly available and regularly updated for all species of conservation concern and a Watch list for species where there is not enough information to determine a conservation status.

Although it is possible rare plants may exist, no rare plants have been observed in the Project Area during various vegetation surveys from 2015 to 2024. It has been assumed that the probability of observing a currently listed rare plant species is low since the Project area does not have landscape features such as hot springs, limestone or alkaline wetlands that are known to be associated with rare plants in the southeast region of the Yukon. But it cannot be concluded that no rare plant exists within the Project area, only that they have not been observed in areas that have been surveyed.

4.5.3 Invasive Species

The Yukon Invasive Species Council has 21 invasive plants on their priority watch list and 50 invasive vascular plant species on their invasive species list by invasiveness. A baseline inventory of invasive plant species was conducted within disturbed areas of the Project Area to determine the existence and extent of any invasive plant species, locations of infestations, and vectors of transportation and spread. Invasive species were observed within the Project Area. During the baseline surveys, invasive species observations were made along the Tote Road with only one invasive species observation within the proposed Project Footprint.

BMC Minerals Ltd has developed an invasive species monitoring program as part of their Invasive Species Management Plan to identify, monitor and manage invasive species populations. The Plan aims to establish a systematic and annual survey schedule with a uniform methodology with the goal to not only facilitate ongoing monitoring of invasive species but will also evaluate the effectiveness of implemented control methods. Currently the invasive species monitoring occurs annually within disturbed areas such as along the Tote Road and infrastructures such as the existing exploration camp. Invasive species have been observed in various disturbed areas within the Project area during theses annual monitoring surveys.

4.6 WILDLIFE

The following sections summarize the Wildlife Baseline Report for the Project area (AEG, 2019) and the Ungulate Baseline Report (BMC, 2023). The Wildlife Protection Plan (BMC, 2024c) and Site Characterization Plan (BMC, 2024d) include additional detail.

4.6.1 Caribou

A focus of the baseline monitoring studies has been, and continues to be, the Finlayson caribou herd. The Finlayson caribou herd is of ecological, economic, and cultural importance in the region to the Kaska, the public, and resident or guided hunters. The herd is part of the Northern Mountain caribou population (*Rangifer tarandus caribou*), assessed by the Committee on the Status of Endangered Wildlife in Canada (COSEWIC) as a species of Special Concern, and listed as such under the Canadian *Species at Risk Act* in 2005. The Finlayson caribou herd uses the uplands around the Project area in the spring, summer, and fall for calving and rutting, and the lowlands of the Pelly River for overwintering. As part of the baseline study, caribou-focused surveys were conducted annually during three key seasons (post calving, rut, and late winter), between March 2015 and March 2023, to assess the spatial and temporal distribution of Finlayson caribou herd throughout the year in the Project area. Table 4-2 shows the resulting counts from each survey.

Table 4-2: Summary of Caribou Observations (2015–2023)

Season and Year	Total Caribou	Cows	Calves	Bulls	Unclassified Adults
Post calving (June)					
2015	93	61	12	20	0
2016	142	103	18	21	0
2017	233	147	43	41	2
2018	197	30	35	20	112
2019	158	97	95	26	0
2020	329	192	34	94	10
2021	378	81	81	78	138
2022	303	64	59	35	145
Rut (October)					
2015	712	449	123	140	0
2016	660	398	107	155	0
2017	463	260	95	108	0
2018	650	see note	96	see note	554
2019	989	541	128	320	0
2020	662	346	69	234	13
2021	704	422	86	196	0
2022	413	240	57	116	0
Late Winter (March)					
2015	19	0	0	0	0
2016	143	109	11	16	7
2017	198	0	23	0	175
2018	61	0	5	0	56
2019	22	3	3	3	13
2020	0	0	0	0	0
2021	43	-	2	-	41
2022	8	-	-	-	8
2023	263	9	9	1	244

Note: During the 2018 rut survey, immature bulls and cows were not classified as conditions did not allow for reliable classification.

4.6.2 Moose

Moose (*Alces alces*) are also a significant wildlife resource to the Kaska, resident, and guided hunters alike. Two different periods (late winter and early winter) were surveyed each year between 2015 and 2023 to assess moose distribution patterns and abundance in the Project area.

During the 2015 late winter survey, a total of 31 moose were observed, as compared to 115 in 2016, 57 in 2017 and 36 in 2018. Results of the 2019, 2020, 2021, and 2022 late winter surveys found a total of 91, 62, 35, 94, and 56 moose, respectively. Variance in relative abundance of moose is

attributed to annual differences in snow age and depth, visibility during the survey, and uniformity of the study area. The distribution of moose observations was nearly uniform through the northern half of the regional study area, with regional distribution likely affected by snow depth. Late winter moose habitats consisted of lowland habitats found in associated with abundant shrubs.

Results of the 2015, 2016, 2017, and 2018 early winter ungulate surveys found a total of 114, 154, 166, and 198 moose, respectively. Results of the 2019, 2020, 2021, and 2022 early winter ungulate surveys found a total of 136, 185, 260, and 228 moose, respectively. During the early winter period, as expected, moose were found in subalpine draws/valleys. Moose were often using the upland areas in the east, south, and west of the Project area.

4.6.3 Grizzly Bears

Grizzly bear (*Ursus arctos*) den surveys were conducted in 2015 (three surveys) and 2016 (two surveys). In 2015, an active den was found approximately 4.5 km southwest of the Project area. It was located on a south facing slope at an elevation of approximately 1,500 masl, a few metres above the treeline. A sow and two cubs were observed about 500 m from the den site, and mud and tracks were observed around the den entrance. In 2016, a grizzly bear sow and sub-adult cub (2+ years old) were observed approximately 3.5 km from the Project area. During the second survey flight, an active grizzly bear den was discovered within 0.5 km of the previous observation of the grizzly bear; the tracks by the den entrance indicated a sow grizzly bear with a young cub. In addition, two freshly dug dens were observed during the 2016 caribou rut count. Exploration wildlife logs from 2015 to 2018 indicate that grizzly bear use the Project area from spring to fall.

4.6.4 Furbearers

Other predators in the Project area include black bear (*Ursus americanus*) and grey wolf (*Canis lupus*). Multiple incidental observations have been recorded, although no targeted surveys were conducted for these species other than the snow track surveys completed in March 2016 and 2017. Black bear observations have only been recorded at lower elevation sites along the Tote Road. Wolf sightings and tracks have been reported during various surveys, as well as by BMC employees and contractors. Wolf observations have been made throughout the Project area from alpine ridges to the boreal forest. Following the wolf control program in the 1980s, wolf populations in the Finlayson Lake area have recovered to regional pre-control numbers of approximately 240.

Other furbearer species, such as wolverine (*Gulo gulo*), American marten (*Martes americana*), red fox (*Vulpes vulpes*), and Canada lynx (*Lynx canadensis*) are present in the Project area. Incidental observations of these species have been reported in addition to track observations made during the snow track surveys conducted in March 2016 and 2017.

Evidence of historic use of Geona Creek and Finlayson Creek by beaver (*Castor canadensis*) is confirmed by the presence of old dams and lodges. In 2015, a beaver survey was conducted along Geona Creek; however, no sign of recent beaver activity was observed. In 2016, a follow-up beaver survey was conducted in the upper reaches of Geona Creek, and again there was no sign of active beaver use. However, there was evidence of recent beaver activity approximately 2.5 km upstream

from the confluence with Finlayson Creek in the form of freshly gnawed willow stems and beaver trails. In 2017, two beaver observations were reported at the headwaters of South Creek.

4.6.5 Collared Pika and Hoary Marmot

Through targeted surveys, collared pika (*Ochotona collaris*) and hoary marmot (*Marmota caligata*) were observed on the mountains on the southern and western sides of the Geona Creek valley, and most observations were outside of the Project area. Pika were observed at high elevation sites that exhibited large, talus rock with crevices below that may provide cover. Although the COSEWIC conservation rank for collared pika is “special concern”, Yukon conservation rank is listed as “secure”. Given the frequency of observations made in 2015, 2016, and 2017, it is suspected that collared pika and hoary marmot are present throughout the Project area at all high elevation sites with suitable habitat.

4.6.6 Bats

There are three species of bat known to exist in Yukon, only one of which is expected to be found in the Project area; the little brown bat (*Myotis lucifugus*). A bat detector was installed at a wetland in the Geona Creek valley for one week in August 2015; no recordings were identified, which confirmed expectations for the subalpine elevation. Two detectors were installed in 2016 at two different wetlands in boreal forest habitat along the Tote Road. Both detectors had some recordings of *Myotis* sp. assumed to be *M. lucifugus*.

4.6.7 Birds

A total of 42 bird species were observed during surveys conducted in 2015, and 61 species were observed in 2016. Among these species, five are reported as at risk by COSEWIC. Olive-sided flycatcher (*Contopus cooperi*), bank swallow (*Riparia riparia*), and barn swallow (*Hirundo rustica*) are considered threatened, while red-necked phalarope (*Phalaropus lobatus*), and rusty blackbird (*Euphagus carolinus*) are considered Special Concern. The most frequently observed species were white-crowned sparrow (*Zonotrichia leucophrys*), American tree sparrow (*Spizella arborea*) and Wilson’s warbler (*Cardellina pusilla*). A total of five habitat types were surveyed including riparian, wetland, alpine, mixed subalpine, and boreal forest. The greatest diversity of birds was observed in the wetland habitat. A golden eagle (*Aquila chrysaetos*) nest was active in 2015 and 2016, presumably by the same pair. The nest is located in the Project area. A northern harrier (*Circus cyaneus*) nest was also located in the Project area in the headwater wetlands of Geona Creek. Other raptor species observed in the Project area include bald eagle (*Haliaeetus leucocephalus*) and gyrfalcon (*Falco rusticolus*). Ptarmigan (*Lagopus* sp.) were frequently observed throughout the Project area at all elevation levels. Spruce grouse (*Falcapennis canadensis*) were often seen along the Tote Road. Large sandhill crane (*Grus canadensis*) flocks fly over the Project area going north in April and south in August and September, with very few landing. In addition, twilight surveys were completed in June 2017 resulting in no common nighthawk (*Chordeiles minor*) and one short-eared owl (*Asio flammeus*) observation.

4.7 SOILS AND GEOLOGY

4.7.1 Soils and Surficial Geology

Glacial, periglacial (ice related), and fluvial processes are the main processes which have been involved in the creation of landforms and the surficial deposits in the Project area (Cominco, 1996). This was confirmed by work conducted by KP in 2015, 2016, and 2017 (BMC, 2024d). The main surficial deposits in the Project area are:

- Alluvial deposits – geologically recent and result from water processes reworking the sediments deposited during the last ice age;
- Glaciofluvial deposits – the result of water processes from the melting of glaciers and ice sheets. The valley bottoms are infilled generally with sand and gravel deposits from alluvial and glaciofluvial processes to depths of up to 20 m. There are some glaciofluvial deposits on the west side of Geona Creek near the confluence with Finlayson Creek where a deposit in excess of 40 m thick is present;
- Glacial till deposits – the result of the direct glacial action. These silty sand and gravel deposits overlie much of the area, ranging in thickness from less than 1 m to up to 10 m. The thickness of these deposits generally decreases with increasing elevation;
- Colluvium deposits – the result of frost loosening of bedrock which is then transported by debris and avalanche flows to the base of steep slopes. Colluvium is generally found above approximately 1,500 masl in the Project area; and
- Organic material – generally less than 0.5 m thick overlies colluvium and glacial till deposits.

In general, the soils in the Project area are acidic sandy loams and are low in macronutrients. Organics occur on gentle slopes and valley bottoms in association with fens and bogs found along drainages. The most common soil order (soil classification based on dominant physical, chemical, or biological properties) encountered during the ecosystem survey were Cryosols. Cryosols are soils that overlay shallow permafrost (less than 2 m below the surface) especially on the north aspects in Spruce/Feathermoss forests and in the valley bottoms where thick organic layers insulate mineral soils from solar radiation. The other orders of mineral soils encountered in the Project area were Dystric Brunisols (displaying some horizontal development) found on south facing mountain slopes and old alluvial plains. Regosols are young soils with a poorly developed “B” horizon. Regosols are mainly located in the alpine, where soils evolve slowly or in floodplain corridors where there is repeated disturbance by high water events.

Soil surveys have been completed across the Project site as part of the baseline environmental monitoring program, including analysis of nutrients and metal concentrations to characterize soil qualities in the Project area (AEG, 2016a).

4.7.2 Permafrost

Site investigations, comprising test pitting and boreholes, were carried out at the site in 1995 and 1996. Additional site investigations, including test pitting, boreholes and installation of thermistors, were carried out in 2015, 2016 and 2017 (BMC, 2024d).

The 1995/1996 field program included 35 test pits that encountered permafrost; a further 40 test pits observed ice lenses and ice segregation, which was interpreted as an active layer rather than permafrost. Permafrost was not identified in any of the 2016 thermistors, however frozen soil and ice were encountered in samples at approximately 1.5 m and 5.0 m from a drill hole in the Class C Storage Facility footprint. Additionally, a monitoring well installed in the Class A Storage Facility area was discovered to be frozen in the bedrock at approximately 6 m below ground surface (KP, 2016b).

Permafrost distribution mapping was completed within the footprint of all planned Mine infrastructure and the Tote Road, including a surrounding 100m wide “buffer zone” so as to fully encompass all potential disturbance (Coregeo and Associates, 2017a). This mapping was based on a synthesis of data from multiple years of geotechnical field investigations and detailed terrain stability and hazard mapping and related field reconnaissance (Coregeo and Associates, 2017b). The results of this mapping are presented in Coregeo and Associates (2017a) and are also shown in the Site Characterization Plan (BMC, 2024d).

4.7.3 Bedrock Geology

The Project is located in the Finlayson Lake District, a crescent-shaped area approximately 300 km long and 50 km wide that extends from Ross River in the north to Watson Lake in the south. The Finlayson Lake District comprises Devonian to Lower Carboniferous (Mississippian) volcanic, intrusive, and sedimentary rocks separated from the Proterozoic and Paleozoic strata of the ancient North American continental margin to the southwest by the Tintina Fault. The combined Yukon-Tanana and Slide Mountain terranes are separated from the ancient continental strata to the northeast by the Inconnu Thrust (Mortensen and Jilson, 1985; Plint and Gordon, 1996; Tempelman-Kluit, 1979).

The Project area is underlain by rocks of Devonian-Mississippian age with the Big Campbell thrust sheet that host the ABM Deposit. The Jules Creek Fault separates the Yukon-Tanana Terrane from the Slide Mountain Terrane in the Finlayson Lake District. The Yukon-Tanana Terrane of the Finlayson Lake District is contiguous with the main part of the Yukon-Tanana Terrane, which underlies most of west central Yukon, after restoration of approximately 425 km of Late Cretaceous right-lateral, strike-slip movement along the Tintina Fault (e.g., Mortensen, 1992; Peter et al., 2007).

The Yukon-Tanana terrane in the vicinity of the Finlayson Lake belt is composed of foliated and lineated greenschist to lower amphibolite-grade metasedimentary, metavolcanic and metaplutonic rocks. The Yukon-Tanana Terrane was imbricated by Permian thrust faulting into the Cleaver Lake, Money, and Big Campbell thrust sheets. The Project is located on the Big Campbell thrust sheet, which is the structurally deepest of the Yukon-Tanana Terrane. The Grass Lake and Wolverine middle Palaeozoic unconformity-bound groups are exposed in the Big Campbell thrust.

Within the Project area, the Grass Lake Group is divided into three main stratigraphy components:

- The “KZK formation”, comprising a felsic volcanic package hosting all significant volcanogenic massive sulphide mineralization;
- The overlying “Upper Sedimentary and Mafic Volcanic Sequence” metasedimentary package (or “Wind Lake formation”); and
- The underlying “Lower Sedimentary Sequence” metasedimentary package.

The KZK formation is a thick felsic, epiclastic and intrusive/flow (dome) complex with minor mafic sills and flows and rare interbedded sediments. Sediments consist of tuffaceous and carbonaceous mudstone, wacke and orthoquartzite.

The Upper Sedimentary and Mafic Volcanic Sequence base is approximately 200 m above the ABM Deposit. It is composed of variably carbonaceous and calcareous mudstone with minor quartzite, siltstone and limestone, intercalated with mafic volcanic and minor felsic volcanic units. It is finer grained than the Lower Sedimentary Sequence formation.

4.8 SEISMICITY

The Project area is located in the Yukon-Tanana Terrane in southeastern Yukon Territory. The Yukon-Tanana Terrane is located on either side of the Tintina Fault, located approximately 30 km to the west of the Project area. The Tintina Fault is a dextral strike slip fault that trends to the northwest and extends from British Columbia to Alaska. The Tintina Fault separates the stable North American continent from accreted terranes to the west. The Tintina Fault is not considered to be currently active by the Geological Survey of Canada (Cominco, 1996).

The Project area is in an area of low seismic activity (Cominco, 1996). This was verified by a study titled Earthquakes and Seismic Hazard in the Yukon–Beaufort–Mackenzie (Hyndman et al., 2005), a preliminary desktop study by Knight Piésold Ltd. (KP, 2016b), and a site-specific seismic hazard assessment (KP, 2024b).

4.9 AQUATIC RESOURCES

The most recent aquatics and ecosystems resources baseline reports for the Project area were published in 2016 (AEG, 2016b) and 2017 (Laberge and Can-Nic-A-Nick, 2017), and includes a summary of the baseline studies conducted in the 1990s, 2000s and 2015 to 2017. The reports present data and observations of baseline fish and fish habitat, stream sediments, benthic invertebrates, periphyton, and chlorophyll *a* surveys. Additional supporting information describing water quality and other aquatic ecosystem physical parameters is also provided for an overall ecosystem context.

4.9.1 Fish

Geona Creek and the small ponds overlying the ABM Deposit generally have low abundances of fish, containing just a few slimy sculpin (*Cottus cognatus*) and Arctic grayling (*Thymallus arcticus*). Further

downstream, adult Arctic grayling occur in Finlayson Creek. Fish sampling in South Creek, North River, and East Creek indicated the presence of Arctic grayling, slimy sculpin, and burbot. No fish were captured in Fault Creek, despite significant effort. Larger rivers and lakes in the region host grayling, lake whitefish, lake trout, burbot and Dolly Varden char.

4.9.2 Aquatics

4.9.2.1 Sediments

Aquatic sediments over the monitoring period (i.e. from the 1990s through to 2017) have shown year to year variability and site to site variability (BMC, 2024d). In general, arsenic, cadmium, copper and zinc are elevated to varying degrees in sediments throughout the study area, indicating that these drainages intersect naturally mineralized zones.

4.9.2.2 Benthic Invertebrates

Benthic invertebrates were collected for community composition and tissue metal analysis from Geona Creek, Finlayson Creek, North River, and East Creek during all aquatic sampling events.

Benthic invertebrate abundance and density was highest in Geona Creek and lowest in Fault Creek, and diversity was greatest in lower Finlayson Creek. Diptera (true flies) were the dominate taxon at most sample locations in the Project area. Diptera, Plecoptera, or Ephemeroptera share dominance in Geona Creek downstream of the Project area, and in the upper portions of Finlayson Creek. The downstream reach of Finlayson Creek is the only site where Oligochaeta (aquatic worms) were the dominant taxon or shared dominance with Diptera. Results from 1995 to 2016 have shown fluctuations in both the density and community composition of benthic invertebrates at all sample locations, but these fluctuations are considered natural as no development has occurred in any of the drainages studied.

The mean metal concentrations in benthic invertebrate tissue documented during the 1995 to 2016 studies were well below the mean concentrations in the Yukon database (Laberge and Can-Nic-A-Nick, 2015, 2017), except in 2014 when metal concentrations were an order of magnitude higher than all other years. Elevated concentrations were not observed again in 2016. High metal concentrations observed in 2014 are believed to be from the laboratory testing the samples as plant tissue rather than as benthic invertebrate tissue.

4.9.2.3 Periphyton

Periphyton sampling occurred in Finlayson Creek, Geona Creek, and Fault Creek in 2015. Abundance and diversity of Periphyton was highest in Geona Creek and lowest in Fault Creek, which was generally consistent with the benthic invertebrate results. Bacillariophyta was the dominant phylum observed at all sites. Bacillariophyceae and Fragilariophyceae were the dominate orders in the phylum, representing an average of 41% to 56% of cells across all sites. All other phyla generally represented less than 1%, except for Cyanobacteria in Fault Creek (4.35%) and Chlorophyta in lower Finlayson Creek (1.6%). *Didymosphenia geminata*, an invasive species, was observed at four

locations throughout the Project area. In all cases Didymosphenia represented <1% of the total number of cells.

4.9.2.4 *Chlorophyll a*

Chlorophyll a concentration provides a measure of algae biomass and therefore the primary productivity of a given location. *Chlorophyll a* concentrations in the Project area are generally low, which is interpreted as an indication of low productivity systems. The highest concentrations were observed at the mouth of Geona Creek and the lowest at the confluence of Geona and Finlayson Creeks.

4.10 HERITAGE RESOURCES

The Project area has been the subject of six Heritage Resources Impact Assessments from 1995 to 2018. To date, four subsurface lithic archaeological sites have been identified by Ecofor Natural and Cultural Resources Consultants (Ecofor). Ecofor have provided BMC with recommendations to manage each site. Recommendations for each site included avoidance and where avoidance was not possible (due to Project design) then systematic data recovery excavations were conducted. Any activity that requires ground disturbance, outside of the areas already assessed, will require a heritage impact assessment before works can begin. All Heritage Resources Impact Assessment reports have been provided to the Yukon Heritage Resources Unit, RRDC and LFN.

A Heritage Resources Protection Plan has been developed to provide strategies to protect and manage heritage resources during all phases of the Project (BMC, 2024e). This will include:

- Ensure heritage assessments have been completed before ground disturbance activities occur in new areas;
- Ensure all known sites are clearly flagged in the field prior to construction activities occurring;
- Review and implement site-by-site management recommendations; and
- Train all site management, Construction, and Operations crews on the communication protocols to manage future ground disturbances and chance finds of heritage resources.

5 PROJECT DESCRIPTION

5.1 PROJECT OVERVIEW

Development of the mineral resource will be by open pit and underground mining methods at a current life of mine annual average rate of approximately 5,500 tonnes of ore per day. The proposed phases of the Mine life are summarized as follows:

- Pre-construction: approximately 2 years;
- Construction: approximately 2 years;
- Operations: approximately 10 years;
- Active Closure: approximately 3 years;
- Transition Closure: approximately 12 years, when water discharges via the ABM lake spillway; and
- Post-closure: approximately 10 years.

Pre-construction and Construction may happen concurrently, pending the timing of receipt of licences. These stages of Mine development are shown in Figures 5-1 through 5-5. Figure 5-1 shows the Project at the end of the Construction phase immediately before Process Plant start-up. Figure 5-2 shows the Project at the end of Operations. Figure 5-3 shows the end of Active Closure, Figure 5-4 shows the end of Transition Closure, and Figure 5-5 shows Post-closure conditions.

5.2 PROJECT INFRASTRUCTURE

5.2.1 Waste Storage Facilities

Waste rock will be classified as Class A, B or C, based on its ARD/ML characteristics and stored accordingly in permanent facilities on surface. In addition, overburden and topsoil material will be strategically stockpiled on surface for reuse during reclamation of the site. All soil disturbed by mining activities will be salvaged for use in future reclamation activities.

Design of the following waste management facilities is described in KP (2019b):

- Class A Storage Facility;
- Class B Storage Facility;
- Class C Storage Facility; and
- Overburden Stockpile.

The details of these facilities are summarized in the following sections.

5.2.1.1 Class A Storage Facility

The Class A Storage Facility is located on the western hillside of Geona Creek, north of the Process Plant area. The principal objectives for the Class A Storage Facility are to provide safe and secure storage of tailings and waste rock, to protect regional groundwater and surface water during Operations and in Closure, and to achieve effective reclamation. Class A waste rock and tailings material are defined as potentially acid generating and metal leaching in the near term (i.e. in the life of the Mine) (Ensero, 2023a). Details of the Class A Storage Facility are presented in the Tailings Management Plan (BMC, 2024a).

The Class A Storage Facility will store Class A waste rock from the ABM open pit, co-disposed with filtered tailings produced at the Process Plant. The facility is designed to manage approximately eight million cubic metres (Mm³) of potentially acid generating filtered tailings and approximately six Mm³ of potentially acid generating waste rock.

Design of the Class A Storage Facility includes the following key design functions:

- Permanent, secure and total confinement of filtered tailings and waste rock in an engineered facility;
- Diversion of clean water around the facility to the extent practicable with use of berms and diversion channels;
- Collection of runoff from the facility with use of lined collection ditches;
- Progressive advancement of the composite HDPE geomembrane liner system;
- Conveyance of groundwater flows beneath the facility;

- Internal facility seepage collection and management during Operations and Active Closure;
- Inclusion of monitoring features to confirm performance goals are achieved and design criteria and assumptions are met; and
- Progressive emplacement of the closure cover on to the facility over the operating life of the Project.

A buttress will be constructed for confinement at the down gradient slope of the Class A Facility, which will improve the overall geotechnical stability of the facility. The buttress will be constructed with selectively sourced Class C (non-potentially acid generating) waste rock material. The buttress has been designed with a 2.5H:1V upstream slope and 3H:1V down gradient slope. Foundation preparation beneath the buttress includes removal of all overburden material, which is estimated to be approximately 10 m in depth.

A layer of low permeability glacial till will be placed and compacted in thin lifts across the facility basin, above the foundation drainage system, to provide a low permeability seepage barrier beneath the facility. An 80 mil, textured HDPE geomembrane will be installed above the compacted glacial till material to form a composite liner system. Crushed sand and gravel will be placed above the HDPE geomembrane for protection from construction vehicle traffic and to collect and convey seepage from within the facility.

The facility will be graded to collect and convey seepage flows to two internal sumps at the base of the facility, at the upstream toe of the buttress. Seepage from the sumps will report to the Class A Collection Pond.

The facility has been designed with an overall slope of 4H:1V. Tailings and waste rock will be co-disposed in the facility in lifts and compacted by vibrating drum compactor.

The facility will be progressively reclaimed with a composite cover as it is constructed. The design of the closure cover includes a layer of glacial till material, covered by an 80 mil, textured HDPE geomembrane to form a composite cover system. The facility will be capped with a sand and gravel protective layer followed by a layer of Class C material for frost protection and to improve long-term geotechnical stability. Growth media will be spread above the Class C rock and the facility will be revegetated as part of progressive reclamation activities during Operations. Note that the recontouring will include benches with berms/ditches to control runoff.

5.2.1.2 Class B Storage Facility

The Class B Storage Facility is located on the western hillside of Geona Creek, south of the Process Plant area. The Run of Mine (ROM) pad and Low Grade Ore (LGO) stockpile are incorporated into the design of the Class B Storage Facility. Class B waste rock is defined as potentially acid generating with metal leaching potential over the longer term (after cessation of mining activities) (Ensero, 2023a).

Class B material requires encapsulation to limit contact with oxygen and water, and therefore the facility will incorporate the same composite liner and cover system as the Class A Storage Facility. The principal objectives for the Class B Storage Facility are to provide safe and secure storage of Class

B waste rock, to protect regional groundwater and surface water during Operations and in Closure, and to achieve effective reclamation. Details of the Class B Storage Facility are presented in the Waste Rock and Overburden Management Plan (BMC, 2024b).

The Class B Storage Facility has been designed with an overall slope of 3H:1V for long-term physical stability and to allow for re-contouring as required for reclamation. Note that the recontouring will include benches with berms/ditches to control runoff.

The Class B Storage Facility includes the following key design functions:

- Permanent, secure and total confinement of Class B waste rock in an engineered facility;
- Diversion of clean water around the facility to the extent practicable with use of berms and diversion channels;
- Construction of a progressively advanced low permeability composite liner system;
- Control and collection of runoff from the facility during Operations to the maximum practical extent;
- Conveyance of groundwater flows beneath the facility;
- Internal facility seepage collection and management during Operations and Active Closure; and
- Progressive reclamation and construction of the closure cover during the Operations phase, with encapsulation and construction of the closure cover of the facility completed at the end of mining (during Active Closure).

A layer of low permeability glacial till will be placed and compacted in thin lifts, above the foundation drainage system, to provide a low permeability seepage barrier beneath the facility. An 80 mil, textured HDPE geomembrane will be placed above the compacted glacial till material to form a composite liner system followed by a sand and gravel protective layer.

The facility closure cover will be progressively constructed during Operations with a composite cover system, the same as that of the Class A Storage Facility. The design of the closure cover includes a layer of glacial till material covered by an 80 mil textured HDPE geomembrane. The geomembrane will be capped with a sand and gravel protective layer followed by a layer of Class C material for frost and erosion protection. Growth media will be spread above this capping layer, and the facility will be revegetated.

5.2.1.3 Class C Storage Facility

The Class C Storage Facility is designed to manage waste rock that is classified as non-reactive or potentially acid consuming and therefore specific ARD management strategies are not required (Ensero, 2023a). The facility is located on the eastern hillside of Geona Creek, in a hanging valley northeast of the ABM open pit. The principal objectives for the Class C Storage Facility are to provide safe and secure storage of Class C waste rock, and to achieve effective reclamation. Details of the Class C Storage Facility are presented in the Waste Rock and Overburden Management Plan (BMC, 2024b).

The Class C Storage Facility includes the following key design functions:

- Permanent, secure confinement of Class C waste rock in an engineered facility;
- Diversion of water around the facility to the maximum extent possible with use of diversion channels; and
- Control and collection of runoff from the facility during Operations to the maximum practical extent.

The Class C Storage Facility will have no infiltration-restricting liner or cover. The facility has been designed with overall face slopes of 3H:1V, while the top of the facility will have a very gently sloping 1% gradient to shed runoff. The final facility bench crests will be rounded and the faces sloped to control runoff, which is a similar configuration to the existing natural slopes in the area. Where possible, Class C material will be used for construction purposes around the site as well as capping material for reclamation of the Class A and B Storage Facilities. The facility will be reclaimed by placing a layer of growth media over the final formation surface before being revegetated. Note that the recontouring will include benches with berms/ditches to control runoff.

5.2.1.4 Overburden Stockpile

The Overburden Stockpile is designed to manage overburden material excavated from the ABM open pit area or from other site infrastructure locations. The stockpile is located on the eastern hillside of Geona Creek, north of the Class C Storage Facility. Suitable glacial till material will be selectively managed and sourced from the stockpile and used during Operations as a construction material, and in Closure for reclamation and select cover material for the other facilities. Details of the Overburden Stockpile design are presented in the Waste Rock and Overburden Management Plan (BMC, 2024b).

The Overburden Stockpile includes the following key design functions:

- Secure confinement of overburden in an engineered facility;
- Diversion of runoff around the facility to the maximum extent possible with use of berms and diversion channels; and
- Control and collection of sediment-laden runoff from the facility during Operations to the maximum practical extent.

The Overburden Stockpile is designed to manage overburden material excavated during Construction and ABM open pit stripping. The stockpile will be used in Active Closure as reclamation cover material for the other Mine waste storage facilities; the remaining stockpile will be recontoured and revegetated.

5.2.2 Water Management Facilities

Water management is a critical component of site operations, and a series of water management ponds will be used to collect, treat as required, and discharge water from site. The water management

objectives and strategies are described in the Water Management Plan (BMC, 2024f). The main site water management facilities include the following:

- Upper Water Management Pond (UWMP);
- Lower Water Management Pond (LWMP);
- Class A Storage Facility Collection Pond;
- Class B Storage Facility Collection Pond;
- Class C Storage Facility Collection Pond;
- Overburden Stockpile Collection Pond; and
- Pit Rim Pond.

Collection ditches and diversion channels have been designed to divert water to the maximum practical extent, and to collect and control runoff into the Project area.

The Water Management Plan utilizes water in the Project area to the practicable extent by collecting and managing site runoff from disturbed areas. Surplus water will be stored on site, with excess water being released in a controlled manner to Geona Creek and to Finlayson Creek. Water will be discharged from site at controlled dilution ratios, as described in the Water Management Plan (BMC, 2024f).

A water balance model was developed to assess potential effects of variability on surface and groundwater flows as the Project develops (KP, 2024a). The Water Management Plan (BMC, 2024f) involves collecting and controlling site runoff from disturbed areas to ensure maximum recycling of mining and process water and control of water quality discharged to the surrounding environment.

5.2.3 Water Treatment Plant

A Water Treatment Plant (WTP) will be constructed adjacent to the Process Plant to treat influent water streams from the Class A Storage Facility, a portion of the process water stream, ROM pad and LGO Stockpile runoff, Pit Rim Pond and Process Plant sumps (Integrated Sustainability Consultants, 2019). Water quality from each of these sources will be monitored to determine if treatment through the WTP is required. The planned treatment system consists of two circuits: a metals removal circuit and a Selen-IX™ circuit for selenium removal. Treated water will be discharged into the LWMP.

5.2.4 Power Generation and Fuel Supply

Power is planned to be generated on site by a dual fuel (natural gas and diesel) power plant located adjacent to the Process Plant. Fuel supply and storage on site includes liquified natural gas for the power plant, and diesel fuel for standalone generators, mining equipment and the power plant. Waste heat from the power plant will be used by the heating, ventilation and cooling system to heat the Process Plant building through a glycol loop.

5.2.5 Mining Infrastructure

Mine workshop facilities will be constructed for both the ABM open pit and underground mining operations. A vehicle wash bay will be constructed adjacent to the Mine workshop facilities. The main diesel storage facility will be constructed adjacent to the Mine workshop. Explosives will be stored in secure, fenced facilities, which will be well separated from the main activity areas. Bulk explosives will be stored within a bulk explosives compound. The bulk explosive compound will also contain a garage for the explosives loading trucks and a small office for the explosives contractor. Magazines will also be established for the storage of packaged explosive products and detonators.

5.2.6 Communications

Site communications are planned to be established via microwave link to connect the Project directly to the Northwestel terrestrial network through the McEvoy Tower, located approximately 36 km northeast of the Project area. One intermediate repeater site will be required, adjacent to the Access Road, to relay the signal to the Mine site.

Satellite communication technology is rapidly evolving and BMC may consider the adoption of this as a means of communication in the future.

5.2.7 Roads

The existing Tote Road will be upgraded to an all-weather, single lane Access Road with sufficient passing bay pull-outs to safely facilitate two-way traffic. The Access Road will be the main access to the site for all traffic including personnel transport, supply trucks and concentrate transport trucks.

In addition to the Tote Road upgrades, approximately 22 km of roads within the Project area will be either upgraded or newly constructed to service the needs of the Project. This will include construction of both light vehicle access roads and Mine haul roads.

5.2.8 Accommodation Camp

An approximately 350 person accommodation camp will be constructed adjacent to the existing exploration camp.

5.2.9 Finlayson Lake Airstrip

The existing Finlayson Lake airstrip is located approximately 40 km from the site and will be the main facility used to fly all Project personnel to and from Whitehorse. Should Finlayson Lake airstrip be unable to be used for any reason, contingency options include airstrips at Ross River, Faro and Watson Lake.

5.2.10 Concentrate Haulage

In general, concentrate will be hauled to Stewart World Port in Stewart, British Columbia via Watson Lake, Yukon for shipping to market.

Should concentrates be sold within the North American market, concentrate may be hauled to a rail siding at Fort Nelson for subsequent rail haulage to the customer, if that transportation route is considered to be more efficient than that of sea freight.

5.2.11 Support Infrastructure

Minor infrastructure that will support the main mining activities on site is summarized in Table 5-1.

Table 5-1: Support Infrastructure Summary

Infrastructure Item	Description
Paste Fill Plant	Produce paste backfill using binder and tailings for the underground Mine.
Warehouse and Administration Complex	Contains various areas to support Mine operations; assay lab, first aid room, maintenance area, cold storage area, Mine dry, warehouse, administration area and office space.
Fire Protection	Fire water distribution system will be installed around the Process Plant and camp area with wall hydrants at strategic locations.
Sewage Collection and Treatment	Sewage will be collected from the accommodation complex and the Process Plant/office. Treatment will occur at a Sewage Treatment Plant. The treated water will then be diverted to a septic field. Bio-sludge from the treatment plant will be buried on site at an approved location.
Production Core Storage Area	Store all drill core produced by the operation. Includes facilities for logging of core.
Accommodation Facilities	Modular accommodation facilities; kitchen and mess facilities; administration office; recreation facilities; laundry facilities; lockers and storage facilities.

5.3 MINING OPERATIONS

The Kudz Ze Kayah Mine, comprising both the ABM and Krakatoa Zones, is planned to operate for approximately 10 years. Details of the planned Mine development are presented in the Open Pit Mine Development and Operations Plan (BMC, 2024g).

5.3.1 ABM Open Pit

The ABM deposit comprises both the ABM Zone and the Krakatoa Zone. The majority of the ABM Zone will be mined by open pit mining methods. A single open pit will be mined that will access the ABM and Krakatoa Zones. The mining of the ABM Zone is currently planned to be staged into four separate phases to manage overall waste stripping requirements and the Krakatoa Zone is planned in a single stage.

5.3.2 Underground Mine

Underground mining is currently anticipated for the lower part of the ABM Deposit. Underground stope voids are designed to be filled with paste backfill.

5.3.3 Ore Processing

The Process Plant and associated service facilities is designed to process ROM ore at rate of up to 2.2 million tonnes per year, to produce separate copper, High Precious Metals (HPM) and zinc

concentrates and tailings, as described in the Process Plant Development and Operations Plan (BMC, 2024h). The processing will consist of the crushing and grinding of ore, separate sequential pre-float, rougher and cleaner flotation of copper, lead and zinc and regrind of copper, lead and zinc rougher concentrates. Concentrates will then be thickened, filtered and stockpiled on site prior to being loaded onto trucks for transport to third party smelters. The flotation tailings will be dewatered by thickening and filtration before being transported either for disposal at the Class A Storage Facility, or combined with binder to produce paste backfill to be emplaced underground as part of the mining cycle (in later years of Operations).

6 TEMPORARY CLOSURE

Temporary Closure for the Project is defined as closure of the undertaking as evidenced by the cessation of development and production authorized by the QML and Type A Water Licence for a period longer than six (6) consecutive months and is not expected to last longer than five years and can include both planned and unplanned closure. This condition assumes that the owner is still in active control of the site (i.e., not abandonment). This section presents how BMC will manage the Project in the event of Temporary Closure.

The approach to Temporary Closure is based on maintaining the site in a state of physical and chemical stability, while also ensuring the site is secure, safe, and in compliance with all regulatory requirements and authorization obligations. While ensuring these conditions, the Project and infrastructure will be maintained in a manner that will facilitate the resumption of mining operations in a timely manner.

The Temporary Closure preparations are described in Section 6.1. The subsequent specific measures employed to meet the Temporary Closure objectives are outlined in Sections 6.2 to 6.5. Monitoring and maintenance programs for Temporary Closure are presented in Section 6.6.

Socio-economic implications of potential Temporary Closure are described in Section 17.4 (Accidents and Malfunctions) of the Project Proposal (BMC, 2017a).

6.1 TEMPORARY CLOSURE PREPARATIONS

If a Temporary Closure condition is triggered through the definition stated in the Project's QML and Water Licence, a notice will be provided to the appropriate authorities stating:

- The nature and reason for the Temporary Closure;
- The anticipated duration of the Temporary Closure; and
- Actions planned to maintain compliance with Project permits and plan approvals.

The focus of the activities to prepare the site for Temporary Closure will be on securing the site in a manner which will allow for continued maintenance of site access, security, water management infrastructure, and any facilities which will be required for adhering to applicable licences, permits, and regulations.

To prepare the site for Temporary Closure, assets not required during the Temporary Closure period will be secured and major contractors will most likely be demobilized depending upon the expected length of the Temporary Closure period. Steps will be taken to reduce the environmental liability during this period. Any parts of the camp and process facilities which will not be used during Temporary Closure will be considered for decommissioning to the extent practical, without undermining the ability of the Project to be successfully and efficiently returned to operation at the end of the Temporary Closure period.

Full-time on site staff will ensure a consistent site presence during Temporary Closure, and the camp will be prepared for reduced staffing levels. The staffing numbers on site at a given time would likely range from four to ten people depending on the circumstances of the Temporary Closure. Environmental personnel will undertake all the environmental monitoring and inspection requirements. Appropriate trades personnel will conduct routine maintenance activities and WTP operators will be employed as required to achieve water management and effluent discharge criteria.

The power plant will be maintained and operated as needed. However, equipment and facilities not required during Temporary Closure will be de-energized, winterized (if required), and secured to allow access only to authorized personnel. Any components of the processing facilities, which are either not required to be in use during the Temporary Closure or which are not likely to suffer negative maintenance outcomes, will be drained, cleaned, and secured. The explosives facilities will be secured to ensure access is limited to authorized personnel only.

6.2 SITE SECURITY AND SAFETY

Site security will be maintained in a manner comparable to the operational period with access to the site controlled by maintaining a consistent presence at the gatehouse. Personnel accessing the site will be required to be on an approved site manifest.

All visitors will be required to check in with the camp administrator upon arrival. All operational safety protocols, plans, policies, and site orientation measures will be maintained and strictly enforced during Temporary Closure. This includes (but is not limited to) all aspects of the Emergency Response and Health and Safety Plan (BMC, 2024i) and Wildlife Protection Plan (BMC, 2024c).

6.3 MINING OPERATIONS AND MINE WASTE FACILITIES

After mining operations have shifted into Temporary Closure, the ABM open pit ramp will be protected against casual and/or unauthorized entry and signage warning of potential hazards will be posted (if not already in place) and otherwise maintained. Access may still be required for water management and/or other monitoring activities depending on when the Temporary Closure commences in relation to the remaining mining schedule.

Underground Mine portals, if developed at the time of Temporary Closure, will have signage posted, if not already in place, warning of hazards. BMC will work with Kaska to develop signage in Kaska Language (not only for Temporary Closure but also in permanent Closure). Access may still be required for water management activities, including maintenance of dewatering equipment, depending upon when the Temporary Closure commences in relation to the remaining mining schedule.

The Class A Storage Facility will undergo progressive reclamation during Operations, which will help to minimize the area of exposed tailings and waste rock if a Temporary Closure is initiated. There are three main potential risks under conditions of Temporary Closure:

- Surface desiccation and wind erosion (dusting);

- Oxidation of the exposed tailings and waste rock; and
- Metal leaching, particularly as the surface dries.

The most appropriate practice for minimizing the potential risks is to place a temporary 'isolation' cover on any exposed tailings and Class A or Class B waste rock surfaces. In the short term (within six months of cessation of development and production activities), a heavy duty plastic cover will be installed over the surface of the Class A Storage Facility. In the longer term (within twelve months of cessation of development and production activities), an overburden cover will be placed over the exposed Class A surface. The cover will be 0.25 m to 0.50 m thick and compacted to be trafficable by construction equipment.

Given the much slower onset of oxidation and metal leaching from the Class B Storage Facility, the expected duration of the Temporary Closure period will be considered when planning for placement of a temporary 'isolation' cover on the Class B Facility. For expected durations of 24 months or less, no action will be taken, unless monitoring identifies conditions that warrant placement of the cover, as per the Project AMP. If Temporary Closure extends beyond 24 months, or is expected to last longer than 24 months, the temporary 'isolation' cover will be placed within 6 months.

The facilities are designed to be physically stable and substantial regrading should not be required during Closure (temporary or otherwise) (although grading will be conducted if needed to support efficient drainage). Environmental and geotechnical monitoring activities will continue per the operational schedule at all Waste Storage Facilities (Section 7.11).

6.4 EQUIPMENT AND PROCESSING FACILITIES

The storage, removal, or otherwise of any equipment, machinery or consumables on site during a period of Temporary Closure is dependent on the expected nature, period and extent of the Temporary Closure and will be judged on a case by case basis. Any equipment remaining on site that is not required for Temporary Closure activities or for any other projected activities will be secured on site. Consumables will be stored and secured on lined areas, inside shops, or underground.

Prior to commencement of Temporary Closure, the crushed ore stockpile and bulk solid reagents (lime and binder) stock levels will be drawn down to minimum levels where practicable. Depending on the expected period of Temporary Closure, binder stocks may need to be removed from site to prevent the risk of binder hardening inside storage vessels. Lime will still be required for ongoing water treatment activities.

Management of explosive products on site will depend on the expected period of Temporary Closure. At a minimum, secure storage on site will be maintained; however, bulk explosives may be removed from site in the event of extended Temporary Closure duration. The explosives supplier will be consulted to determine the most appropriate approach after taking the expected Temporary Closure period into account.

Slurries will be drained from all process equipment and tanks, which will then be flushed with water. Residual reagent solutions remaining in mixing and storage tanks will also be drained and flushed

with water and treated in the Water Treatment Plant. Reagents in stock will initially be secured in the reagent storage area, with removal from site considered for an extended Temporary Closure period. Grinding media in the semi-autogenous grinding mill, ball mill and stirred regrind mills will be removed and stored for reuse when operations recommence.

The WTP and associated infrastructure will remain operational for ongoing water treatment requirements as discussed in Section 5.2. Lime will continue to be used on site for water treatment; however, at lower quantities than when the Process Plant is operational.

A care and maintenance crew will be responsible for maintaining the (shutdown) Process Plant and equipment, including periodically servicing all electrical motors to maintain bearing condition and ensuring essential services, such as the fire water pumps and the potable WTP, are on standby and can be run if required.

Any hazardous materials remaining on site during Temporary Closure will be stored in secured areas or buildings as appropriate and as authorized. Reagents required for water treatment during Temporary Closure will be stored in a secured manner, limiting access to authorized personnel only. The Waste Management Facility (WMF) will be managed per approved management plans and YG permit conditions as outlined in the Waste Management Plan (BMC, 2024j).

Fuel storage will be utilized in a reduced manner during Temporary Closure and will be secured and maintained by site staff.

The ROM pad and LGO stockpiles will be left in place at the time of initiating Temporary Closure, as they are incorporated into the Class B Storage Facility. They will be inspected periodically (i.e. annually) with other site facilities for physical integrity, and signs of erosion. All runoff from the stockpiles will continue to be collected and treated as during Operations.

6.5 WATER MANAGEMENT

The strategy from the Water Management Plan will be maintained in the event of Temporary Closure (BMC, 2024f). Existing diversions, seepage collection systems, water storage structures, and treatment systems will be maintained and utilized/operated as planned for the period of Temporary Closure. The water management strategy includes the following key principles:

- Water collected will continue to be treated as per the Water Management Plan such that it is acceptable for discharge and in compliance with all applicable regulations, licences, and permits;
- Water will continue to be diverted around the site in existing diversion channels/ditches. These channels and ditches will be maintained through Temporary Closure to ensure that non-impacted water is being appropriately diverted;
- The Water Treatment Plant will continue to be operated; and
- The ABM open pit and underground mine will continue to be de-watered during Temporary Closure as required. If the underground workings are developed to the point of needing

substantial dewatering, the dewatering activities will continue during Temporary Closure. The dewatering may be discontinued if deemed necessary (for example: to reduce the quantity of water requiring management, treatment and discharge).

6.6 MONITORING AND MAINTENANCE

During Temporary Closure, the site will be monitored in compliance with the approved Environmental Monitoring, Surveillance and Reporting Plan (EMSRP) (BMC, 2024m) and Adaptive Management Plan (AMP) (BMC, 2024n), the site Operations Maintenance and Surveillance Manual, and all lease and permit requirements.

Monitoring and inspection activities will include, but not be limited to:

- Environmental protection monitoring and reporting as per the approved EMSRP and AMP;
- Physical stability inspections as per the Sediment and Erosion Control Plan (BMC, 2024k), looking for signs of instability and problematic erosion/sedimentation;
- Inspections of the water conveyance systems to ensure the facilities function as designed;
- Inspections of equipment, buildings, and processing facilities to ensure that they remain in good repair; and
- Follow-up investigation by the appropriate personnel, as warranted, based on reports of changes to the physical status of any part of the site.

Facilities and equipment required during Temporary Closure will be maintained on a preventative maintenance program similar to that used during Operations. Maintenance activities are likely to include, but not be limited to:

- Maintaining the physical stability and functionality of diversion channels;
- Maintenance of water conveyance equipment and systems;
- Maintenance of the Access Road and site service and haul roads including surface drainage, ditches, culverts, and road grading as required;
- Maintaining progressively reclaimed and temporary cover areas of Waste Storage Facilities to prevent/minimize erosion and sedimentation;
- Maintenance of seepage collection and sediment control ponds;
- Preventative maintenance of equipment;
- Maintenance of the WMF;
- Maintenance and securing of fuel storage areas; and
- Maintenance and operation of the WTP.

7 FINAL RECLAMATION AND CLOSURE MEASURES

This chapter outlines the final RCP for the Project. The information presented in this Chapter ensures that closure measures:

- Support the defined closure goals and objectives;
- Are technically feasible;
- Support the evaluation of potential environmental and socio-economic effects from the Project (in the Closure phases); and
- Are sufficient to support a detailed closure liability cost estimate.

The following sections present specific closure objectives and corresponding criteria and measures for both broadly applied (general reclamation) measures, and specific Project facilities (e.g., ABM open pit, Class A Storage Facility). Dialogue and involvement of Kaska representatives will be ongoing throughout all Project phases and therefore, the closure measures presented in this Chapter are expected to be refined from time to time as a result of ongoing engagement.

7.1 GENERAL RECLAMATION MEASURES

Reclamation of the Project will rely on a combination of standard, commonly applied strategies as well as some Project and component-specific measures aimed at meeting all reclamation and closure objectives. Section 3.1 outlined the fundamental reclamation and closure objectives that YG's Mine Closure Guidelines dictate must be achieved through closure and reclamation measures (YG, 2013). The general or broadly applied measures planned to meet these fundamental objectives are summarized and described in this section.

Table 7-1 summarizes the general reclamation and closure objectives and measures for the Project.

Table 7-1: General Reclamation and Closure Objectives and Measures

Value	Reclamation and Closure Objectives	Measures
Physical Stability	All Mine-related structures and facilities are physically stable and performing in accordance with design. All Mine-related structures, facilities and processes can withstand severe climatic and seismic events.	The objectives are all achieved through design that considers the long-term performance of the facility. Facilities are constructed on stable foundations, with appropriate factors of safety, and appropriate design criteria for extreme climatic events.
Chemical Stability	Release of COPIs from Mine related waste materials occurs at rates that do not cause unacceptable exposure in the receiving environment.	The Class A and B Storage Facilities are lined and covered with a composite liner system to minimize contact with oxygen and water, and to minimize impacted runoff/seepage. The Class A and B Storage Facilities contain seepage collection systems and collection ditches to manage impacted water. Active water treatment infrastructure and capacity will be retained on site until passive water treatment system(s) are achieving performance criteria. ABM lake water will be treated with lime, ferric iron and carbon sources as required as it fills to reduce COPI concentrations prior to release. Progressive reclamation and revegetation strategies will minimize the potential for windblown tailings/dust mobilization.
Health and Safety	Reclamation eliminates or minimizes existing hazards to the health and safety of the public, workers and area wildlife by achieving conditions similar to local area features. Reclamation and closure implementation avoids or minimizes adverse health and safety effects on the public, workers and wildlife.	All worker health and safety systems, protocols and preventative measures employed during Operations will continue during the Closure phases. Infrastructure and facilities deemed by BMC to not be required for closure activities will be decommissioned and removed from the site. The ABM open pit will be signed and barricaded (ramp access and two berms will be constructed around pit rim) to minimize the potential for deliberate or inadvertent access by humans or wildlife.
Ecological Conditions and Sustainability	Reclamation and closure activities protect the aquatic, terrestrial and atmospheric environments from Mine-related degradation and restore environments that have been degraded by Mine-related activities. The Mine site supports a self-sustaining biological community that achieves land use objectives.	Revegetation strategies are informed by a comprehensive terrestrial ecosystem mapping inventory of pre-existing conditions. Revegetation prescriptions for disturbed areas will balance the objectives of restoring like ecosystems with erosion stabilization and stability monitoring objectives. Revegetation prescriptions will also consider traditional foods and medicines and input from Kaska.
Land Use	Lands affected by Mine-related activities (e.g., building sites, chemical and fuel storage sites, roads, sediment ponds, tailings storage facilities, and waste rock storage areas) are restored to conditions that enable and optimize productive long-term use of land by wildlife and Traditional Use by Kaska (focused primarily on hunting). Conditions are typical of surrounding areas or provide for other land uses that meet community needs, interests, and expectations through discussions and involvement from Kaska representatives from RRDC and LFN.	Wildlife use has been well documented, and TLU is understood at a general level. Habitat and land capability requirements of species that are key to the primary TLU of hunting (caribou and moose) are the basis of the development of revegetation prescriptions for all reclamation activities.

Value	Reclamation and Closure Objectives	Measures
Aesthetics	Reclamation outcomes are visually acceptable.	Class A, B, and C and Overburden Storage Facilities have been designed with slopes and features that mimic the surrounding topography. No constructed facilities will be higher than surrounding features (i.e., not visible from afar). Revegetation strategies will employ native species and will be informed by vegetation communities on similar slopes, aspects and elevations in the surrounding area.
Socio-economic Expectations	Reclamation and closure implementation avoids or minimizes adverse socio-economic effects on local and Yukon communities, while maximizing socio-economic benefits. Reclamation and closure activities achieve outcomes that meet community and regulatory expectations.	The Project has been planned and designed to minimize long-term maintenance and management requirements (e.g., filtered tailings, passive water treatment, lined/covered waste facilities, no embankments remaining in Geona Creek). There is a Socio-economic Participation Agreement in place with Kaska, and this agreement contains a framework for contract preference, which will persist and apply in Closure/Post-closure. Commitments have been made as part of the Information Request Response Reports that meet community and regulatory expectations (e.g.: use of the composite HDPE liner/cover systems, removal of overburden from beneath the Class A Storage Facility buttress). Commitments have been made as part of a Failure Modes Effects Assessment (FMEA) workshop (e.g. double berm constructed around the perimeter of the ABM open pit).
Long-term Certainty	Minimize the need for long-term operations, maintenance and monitoring after reclamation activities are complete.	The Project and the closure measures are designed to minimize long-term maintenance and management requirements (e.g., dry-stacked tailings, passive water treatment, lined/covered waste facilities, no classified water retention structures remaining).
Financial Considerations	Minimize outstanding liability and risks after reclamation activities are complete.	Facilities designed for closure; alternatives assessment considered closure conditions for waste placement to minimize environmental liability and therefore costs to conduct reclamation and closure activities. A FMEA was completed to further identify potential failure modes and effects, and to refine closure measures to reduce risk and costs at Closure and in Post-closure (Appendix A).

7.1.1 Re-grading and Re-sloping

The Class A, Class B and Class C Storage Facilities were designed for ease of closure (i.e., forms and slopes are appropriate to meet closure objectives), therefore there are limited requirements for substantial earthworks to re-grade the facilities for long-term physical stability. Progressive reclamation of the Waste Storage Facilities will be adopted during Operations and will use standard earthworks methods with appropriate machinery (e.g., dozers, graders and backhoes).

Reclamation methods that reduce equipment traffic during soil redistribution and placement will be utilized to lessen compaction of soil in stockpiles and reclaimed areas. For example, where practicable, instead of a dozer, a backhoe will be used to distribute topsoil cover in the reclaimed areas. Ripping will be used in areas where surficial soils are excessively compacted.

7.1.2 Revegetation

Revegetation is a key component of Mine reclamation and is a critical measure employed to meet a variety of Mine Closure objectives, including erosion control and reclamation of land use and habitat

capability. Land use for activities of traditional hunting, trapping, and gathering that were unable to be maintained during Operations will also be restored through revegetation and reclamation of wildlife habitat.

The revegetation plan is based on information from the baseline terrestrial ecosystem mapping for the Project area (AEG, 2016a). The Terrestrial Ecosystem Map shows what groups of plant species (vegetation associations) grow on different types of soils in the Project area. The types of soils are categorized into ecosites, which are defined by the nutrient and moisture regimes at various elevations, aspects, and slope gradients.

Figure 7-1 shows a portion of the Terrestrial Ecosystem Map for the Project area where baseline conditions exhibit a variety of vegetation associations, dominated mostly by scrub birch (dark yellow) and willow (red) with some subalpine fir (purple), white spruce (green), and grasslands (yellow).

(Last edited by: mducharme.9/6/2019/5:03 AM - edited in corel draw - November 2019.)

The final surface of all impacted Project areas will be recontoured, covered with suitable growth media where required to promote vegetation growth and then revegetated. Stockpiled topsoil and overburden materials were assumed to be nutrient poor based on experience at other metal mines in BC and Yukon (Polster, 2013) and as demonstrated in baseline soil sampling at the Project (AEG, 2016a). When soil is stripped during construction and stockpiled it can lose structure, nutrients, and microbial communities, seeds in the soil lose their viability, and anaerobic conditions develop that degrade the soil further (Strohmayer, 1999). Ideally, storage of soil in low berms, less than 1 m deep, re-vegetating stockpiles, and staging progressive reclamation to minimize soil storage times help retain soil nutrients and biota and improves revegetation success (Strohmayer, 1999). However, stockpile depth needs to be balanced with minimizing the footprint of surface disturbance.

To promote the most effective use of topsoil salvaged from Project development, BMC will adopt the following principles for topsoil management:

- Remove topsoil just prior to when excavation is required (to reduce potential for erosion);
- Reuse topsoil immediately in reclamation where possible (to limit rehandle and promote the preferential use of the most viable topsoil);
- Limit rehandling of topsoil where practicable, including when soil is too dry or too wet (to reduce dust and erosion and maintain soil viability);
- Limit the size of topsoil stockpiles (to reduce the impact of heating the pile and therefore maintain seed viability as much as possible);
- Where topsoil stockpiles are required to be maintained for a long period, apply seed to promote natural cover; and
- Reseed topsoil as soon as reasonably possible immediately after placement and contouring when completing reclamation works (to limit potential for erosion).

Continuous progressive construction and reclamation techniques will reduce the potential for deconditioning of stripped soils as far as is practicable. Paquin and Brinker (2011) found retaining large woody debris in stripped soils helped retain nutrients and promote revegetation; this technique may be used for the topsoil stockpiles.

Long-term vegetation associations were estimated based on the predicted ecosites on the Waste Storage Facilities. Short-term revegetation goals were also targeted, incorporating known revegetation seed mixes and recommendations as outlined in the Yukon Revegetation Manual (Matheus and Omtzigt, 2013). Once pioneer species of vegetation develop through seeding and planting, surrounding plants should take over through succession with the expectation that more diverse, long-term vegetation associations will develop (Polster, 2013). Table 7-2 summarizes the expected ecosites to be available on each component of the various post-mining landforms, the target species for seeding and planting in the short-term, the long-term target vegetation associations expected to develop through natural succession, and the primary wildlife species expected to use the resulting habitats. Existing and predicted ecosystems by leading species are shown in Figure 7-2.

The expected wildlife use of the resulting habitats shown in Table 7-2 is based on baseline wildlife suitability mapping which only describes the suitability of a habitat to meet a specific wildlife species' life requisites such as rutting, breeding, shelter. The suitability mapping does not confirm presence or use of a habitat by a species, but describes how suitable the habitat is for the described life requisite. It could be assumed that once an area has reached the revegetation objectives described then it also has the potential of being suitable habitat for the species and life requisite described. For example, for moose, the post rut period and the late winter period were considered the most important life requisites for moose in the Project area. Wildlife surveys and incidental observations have recorded many different wildlife species throughout the Project area including around proposed infrastructure, so it can be assumed that successful reclamation will provide similar habitat for wildlife species that have been observed. The wildlife program will continue to monitor the presence of wildlife species and the use of reclaimed areas.

In the long-term, vegetation associations are expected to be dominated by scrub birch on the various waste storage facilities and on the slopes surrounding Geona Creek due to the expected low moisture and nutrients (Figure 7-3).

Table 7-2: Post-Mining Land Use - Revegetation Objective and Potential Wildlife Use

Facility	Facility Sub-Area	Area (ha)	Target Ecosite # / Nutrient-Moisture Regime	Short-term Target Revegetation Treatment and Rationale	Long-term Target Post-Mine Vegetation Association	Estimated Post-Mine Habitat Suitability
Class A Storage Facility	Top	33	Subalpine 23/ Poor-Mesic	Grasses and forbs. Seed with commercial and locally collected native seed mix, fertilize. Plant scrub birch seedlings.	Scrub birch, willow, and crowberry.	Caribou rut, moose post-rut, grizzly bear, wolf, small mammals, and upland game birds.

(Last edited by: mducharme 9/6/2019 10:12 AM)

Permafrost is expected to redevelop on the post-mining landforms, especially the north aspect slopes, which will influence the resulting revegetation. Revegetation is planned to also include planting scrub birch, blueberry, and low bush cranberry seedlings on flatter, moister slopes to restore habitat for some of the larger focal wildlife species. Berry bushes are a target species to help create suitable habitat for grizzly bear and are also traditionally important plants for Kaska (Wein and Freeman, 1995). A revegetation target of grasses and low shrubs on upper portions of facilities is expected to restore suitable caribou habitat. It is expected that subalpine fir will recolonize the edges of facilities over time, in particular on the Class C Storage Facility where north aspect slopes will retain more moisture. Wetlands and riparian vegetation are expected to develop along Geona Creek where there is more moisture present. Willow staking will be employed to help restore riparian vegetation and suitable habitat for moose, as well as wetland habitat for many other wildlife species. Overall, it is expected that furbearers, small mammals, and game birds will also use the restored grass and shrublands.

Revegetation is challenging on northern Mine sites (Adams and Lamoureux, 2005). Revegetation has been found to be most successful on flatter slopes with native species and natural recolonization (EBA, 2011). Re-establishing the bacteria and fungi in the soils has also been found to be a limiting factor to revegetation on sterile soils (Bowker, 2007). Research has shown that amending the overburden with native bacteria, fungi, and bryophytes helps re-establish the biological soil crust which improves the success of seed germination (Bowker, 2007; Stewart, 2013); therefore, research with soil amendments is planned for reclamation to develop a biological soil crust and promote succession.

Maintaining biological diversity is a key management strategy. More diverse vegetation and wildlife communities can be developed by increasing heterogeneity of facilities to create a variety of microenvironments (Polster, 2013). This will be achieved by contouring slopes loosely and less uniformly, which reduces wind and water erosion and allows for better retention of moisture and accumulation of fines (Polster, 2013). Non-uniform seeding and planting can also help develop habitat diversity. The planned seed mixes for the revegetation program are discussed below.

7.1.2.1 Species Selection

To date two types of seed mixtures have been used at the Project (Table 7-3), a dry area mix and a wet area mix. This list will be expanded and/or updated to include additional site-specific native plants in consultation with Kaska and as more information becomes available from the ongoing revegetation research programs at site.

Table 7-3: Seed Mixture used for Reclamation

Dry Area Seed Mix (2015)	Dry Area Mix (2016)	Dry Area Mix (2017 and 2018)	Wet Area Seed Mix (2015 and 2016)
37% Violet Wheatgrass (<i>Elymus violaceus</i>)	37 % Slender Wheatgrass (<i>Elymus trachycaulus</i>)	37% Slender Wheatgrass	40% Violet Wheatgrass
25% Rough Fescue (<i>Festuca altaica</i>)	25% Rough Fescue	15% Ticklegrass (<i>Agrostis scabra</i>)	33% Fowl Bluegrass (<i>Poa palustris</i>)
25% Rocky Mountain Fescue (<i>Festuca saximontana</i>)	25% Rocky Mountain Fescue	35% Rocky Mountain Fescue	27% Tufted Hairgrass
13% Glaucous Bluegrass (<i>Poa glauca</i>)	13% Tufted Hairgrass (<i>Deschampsia cespitosa</i>)	13% Tufted Hairgrass	

BMC plans to add locally collected seeds into its reclamation program and to support this program and the reclamation research BMC commenced collecting seeds from site in 2017 (in collaboration with RRDC and LFN). Seed germination is usually low in colder subalpine areas and locally collected seed germination has been found to be more successful. A combination of naturalized, commercial native seed mixed with locally collected seeds is therefore planned for the Mine reclamation program. Commercially available native species will be trialed on site based on facility-specific soil pH and nutrient content of the final reclamation covers.

The pH of soils at site is generally slightly acidic ranging from 5.94 to 6.24 for Site S-1 and 4.9 to 5.56 for S-2 (Appendix B). The Yukon Revegetation Manual (Matheus and Omtzigt, 2013) recommends Rocky Mountain fescue (*festuca saximontana*) and violet wheatgrass (*elymus*) for alkaline soils, glaucous bluegrass (*Poa glauca*) for a broad range of pH, and, ticklegrass (*Agrostis scabra*), tufted hairgrass (*Deschampsia cespitosa*), alpine bluegrass (*Poa alpina*), and spike trisetum (*Trisetum spicatum*) for acidic soils. Species that are recorded at site and recommended by Matheus and Omtzigt (2013) include alpine sweetgrass (*hierochloe alpine*), mountain timothy (*Phleum pratense*), alpine sagewort (*Artemisia norvegica*), arctic lupine (*Lupinus arcticus*), and mountain avens (*Eightpetal mountain-avens*).

Progressive revegetation on the Class A Storage Facility is planned to start with combined commercially available and locally collected native seed mixes. Table 7-4 summarizes the planned seed mixes for these facilities. The tops of these facilities are expected to be acidic, moister than the slopes, and nutrient poor; therefore, the seed mix is planned to start with glaucous bluegrass, ticklegrass, tufted hairgrass, alpine bluegrass, alpine sweetgrass, and arctic lupine. The slopes of these facilities are expected to be acidic, well drained, and nutrient poor; therefore, the seed mix is likely to start with glaucous bluegrass, alpine bluegrass, mountain timothy, and alpine sagewort. For revegetation success, Matheus and Omtzigt (2013) recommend seeding on subalpine sites should not exceed 1,500 seeds/m² and fertilizer should not exceed 50 kg/ha of nitrogen.

Table 7-4: Proposed Initial Species for Revegetation

Facility Areas	Commercial Native Species (seeds)	Locally Collected Native Species (seeds)	Locally Collected Native Species (staging or seedlings)
Class A, B and C Storage Facilities - Tops	Glaucous bluegrass, ticklegrass, tufted hairgrass, alpine bluegrass	Alpine sweetgrass, mountain timothy, and arctic lupine	Scrub birch seedlings (near edges of facility) <i>Vaccinium</i> sp. seedlings
Class A, B and C Storage Facilities - Slopes; and Overburden Stockpile	Slender wheatgrass, glaucous bluegrass, alpine bluegrass	Northern rough fescue, wheatgrass, alpine sagewort	-
Water Management Ponds	Tufted hairgrass, fowl bluegrass, American sloughgrass	Northern rough fescue, arctic lupine	Willow staging (felt leaf willow, <i>Salix alaxensis</i> preferred; plus, plane- leafed willow, <i>S. planifolia</i> , and small tree willow, <i>S. arbusculoides</i>)
Process Plant and Ancillary Facilities	Slender wheatgrass, rough fescue, Rocky Mountain fescue, tufted hairgrass	Northern rough fescue, wheatgrass, arctic lupine	-
Site Service and Haul Road	Slender wheatgrass, rough fescue, Rocky Mountain fescue, tufted hairgrass	Wheatgrass, sagewort, wormwood, arctic lupine	-

The revegetation treatments proposed in the overall revegetation program will be tested and optimized through the on site research program during progressive reclamation. A reclamation research program has been designed and is described in Section 2.5. This program will include the development and implementation of multiple studies through the Project life to evaluation measures needed to meet Project reclamation objectives. In 2018, an initial research program was implemented to assess various approaches to regenerating vegetation covers on disturbed areas. These initial trial plots examine a combination of different revegetation treatments to determine the most efficient and effective closure option, including assessment of the best way to support growth of vegetation species that are naturally adapted to the area.

Additional trial programs trials may include but are not limited to:

- New seed and fertilizer treatments based on the results of the 2018 trial sites, available seeds, soil analysis and site conditions;
- Research into germination and propagation techniques;
- Install additional sites in riparian areas and the high boreal ecozone; and
- Monitor trial sites and plots throughout the growing seasons to assist in determining germination success and plant growth and to monitor ingress by adjacent natural vegetation.

Mosses and lichens comprise a large proportion of groundcover in the Project area (Figure 7-1; AEG, 2016a). Reclamation research has been conducted by Yukon University and its partners on ways to rebuild this biological soil crust, a layer of soil that contains necessary mosses, fungus, lichen, algae, and bacteria necessary for successional reclamation of low organic overburden such as that found at Mine sites (Stewart, 2013). Additional research has been undertaken using biochar to restore soil nutrients. Project revegetation strategies and treatments will also consider ongoing research on other projects that will work to restore the native moss and lichen groundcover at site.

An integral component of the revegetation program will be input and participation by Kaska and therefore, the closure measures presented above are expected to be refined from time to time with ongoing engagement, especially in integrating Kaska traditional knowledge for the area.

7.2 ABM OPEN PIT

Table 7-5 presents the closure objectives specific to the ABM open pit closure, grouped by value categories (e.g., physical stability and safety, environment and land use). This table also summarizes relevant design criteria and closure measures that have been developed to achieve the objectives, and performance criteria which will be used to define achievement of the objectives in Closure monitoring.

The ABM open pit and surrounding areas will undergo reclamation to ensure that the pit walls are stable and pose no danger to the general public or local wildlife. Double rock safety berms will be constructed around high wall edges to prevent inadvertent access by people or wildlife. The concept of the double berms was introduced as a mitigation measure resulting from the FMEA, presented in Appendix A. The ABM open pit will be allowed to flood once dewatering of the pit ceases. Fault Creek will also be redirected to the ABM open pit. This will help provide a long-term control on oxidation and metal leaching from the pit walls.

Table 7-5: ABM Open Pit Closure Measures Summary

Value	Specific Closure Objective	Closure Performance Criteria	Closure Design Criteria/Closure Measures
Physical Stability	Minimize potential for pit wall collapse	No major pit wall failures which compromise engineered outflow or pit crest stability	Overburden designed with 25° slope angle in the valley floor, 30° slope angle on western and eastern valley walls. ABM open pit slope inter-ramp angles designed between 36° and 52° based on geotechnical considerations.
	Provide safe egress from the pit (if someone or something falls into it)	No casualties as a result of not being able to egress pit	Egress location maintained at ABM lake engineered spillway.
Chemical Stability	Minimize COPI loading from the pit in the closure period	ABM lake water quality is in predicted range of COPI concentrations	Batch treatment of ABM lake (add lime, and organics, with initial filling of pit if required) to address flushing of secondary mineralization and related metal concentrations.
	No active water treatment required to maintain chemical stability or environmental compliance	No active water treatment in Post-closure	In situ pit water treatment and contingency passive treatment (CWTS) in Geona Creek.
Health and Safety	Prevent inadvertent access to the pit (falling in over the edge)	No casualties as a result of falling into pit	Limit access to ABM open pit crest with safety double berms, setback from the crest, as per commitments made during the FMEA (Appendix A).
Land Use / Ecological Conditions and Sustainability	Limit impact on wildlife, in particular waterfowl	No wildlife mortalities due to exposure/use of ABM lake	In situ pit water treatment. Wildlife barrier (double berm) around ABM lake walls.
Financial Considerations	Minimize outstanding liability and risks in Post-closure, and	Monitoring surveillance and adaptive management	Removal of Fault Creek diversion removes long-term maintenance requirement.

Value	Specific Closure Objective	Closure Performance Criteria	Closure Design Criteria/Closure Measures
/ Long-term Certainty	minimize the need for long-term operations, maintenance and monitoring in Post-closure	programs are executed as planned without increasing maintenance demands	Engineered spillway to control outflow from ABM lake and double safety berms around high wall.

The accumulation of soluble secondary minerals during weathering of the exposed pit walls and pit floor may result in the presence of elevated trace element concentrations in pit water during its flooding. Water quality data collected from the ABM open pit during its initial filling will be used to determine if lime addition is necessary to control pH. Acidic conditions are not anticipated due to the limited presence of acid generating pit wall lithologies and the alkalinity of water sourced from Fault Creek and from groundwater. Placement of Class C waste rock in ABM pit prior to filling may also be considered should greater than expected proportions of acid generating lithologies be present in the final pit wall. If some limited lime addition is required, it can be added to the ABM lake to raise the pH to circumneutral levels (target pH of 8.0), which will also facilitate metals precipitation from solution in the ABM lake. Lime handling and slaking systems (if required) will be performed using equipment associated with the WTP. The slurried lime will be trucked to the ABM lake and pumped into the flow of Fault Creek as it enters the ABM open pit to achieve adequate mixing of the lime in the ABM open pit water. Additional mitigation measures or adaptive management measures may also be applied to areas of the exposed pit walls at select locations that are not Class C material. An Adaptive Management Initiative (AMI) for ABM lake water is presented in Section 7.2.1.

Water quality modelling suggests that the ABM lake that forms will contain elevated COPI concentrations, which without appropriate treatment will not meet the water quality objectives established for the Project when the ABM lake starts to overflow downstream (BMC, 2024f). Given the expected circumneutral pH of the ABM lake water, there is not expected to be sufficient dissolved iron in the lake to enhance metals removal during lime amendment by co-precipitation with iron oxyhydroxide phases.

Soluble organic carbon (e.g., glycerol, alcohol, or molasses) will be distributed throughout the ABM lake, either via direct addition to the discharging Fault Creek water or via piping or water cannons, to stimulate the development of reducing conditions. Sufficient organic carbon will be added to result in the consumption of dissolved oxygen, nitrate and nitrite, and to cause the partial conversion of some dissolved sulphate to sulphide. Under such reducing conditions, elements such as selenium and uranium are largely transformed to less soluble forms (e.g., elemental selenium and uraninite phases). Chalcophile elements such as cadmium, zinc, copper, antimony, and lead will precipitate as poorly soluble sulphide minerals. The insoluble phases formed in the water column will settle to the lake bottom for long-term storage. Reactive iron sulphide minerals will also form during treatment, which will help scavenge some COPI via co-precipitation and also act as a sacrificial anode to maintain the reduced COPI in their stable precipitated forms in the lake sediment.

Addition of the soluble organic carbon will occur during filling of the ABM lake. Treatment will be initiated in late summer at a time when microbial respiration rates are highest. As reducing conditions develop over the subsequent months, the formation of an ice layer over the lake will help limit the ingress of oxygen and prolong the period of time that the lake will remain reducing, thus maximizing COPI removal.

Pilot-scale test work was completed by Ensero to evaluate the dosage of organic carbon (molasses and glycerol), ferric iron, nitrogen, and phosphorus, and the effects of soil amendment and temperatures on the efficacy of the proposed in situ treatment, as described in Appendix C.

Water quality monitoring of the ABM lake will be used to evaluate the lake chemistry and ensure that the concentrations of COPI, which are expected to respond to in situ treatment (e.g., nitrite, zinc, cadmium, copper, nickel, lead, antimony, selenium, and uranium), are minimized. ABM lake water quality will also be compared with water quality standards for the protection of livestock to ensure that wildlife is also protected. Monitoring will include the collection of samples at strategic depths in the water column to evaluate the development of any stratification, since the presence of an anoxic hypolimnion (the lower layer of water in a stratified lake) at depth will further assist the preservation of the reduced COPI in their stable precipitated forms. If water quality monitoring indicates that ABM lake treatment is to not adequately effective, the AMI presented in Section 7.2.1 would be triggered, including implementation of additional and/or alternative treatment methods. This is in addition to the construction of the CWTS, as a redundant water treatment measure.

An engineered spillway will be constructed to control outflow from the ABM lake. The spillway will be constructed at the north end of the ABM lake, so that flow is directed into Geona Creek (not South Lakes).

7.2.1 Adaptive Management

The Project Adaptive Management Plan (BMC, 2024n) presents Adaptive Management Initiatives (AMIs) for multiple aspects of the Project, focusing on the Construction and Operations phases of the Project, as discussed in Section 7.12.2. Details of adaptive management for Project closure will be developed in detail once Operations have been underway for some time and the AMP has been implemented and validated. An AMI for ABM lake water quality is provided here, in response to Decision Document Term 31. This AMI will be updated and incorporated into a future revision of the Project AMP.

7.2.1.1 Description

As discussed in Section 2.5.3, treatment of ABM lake water using organic carbon dosage and ferric iron addition has been shown to significantly decrease concentrations of certain COPIs. As discussed in the Water Management Plan (BMC, 2024f) and detailed in the Water Quality Model report (Ensero, 2024), it is expected that this treatment approach will lead to all WQOs being met in the receiving environment once ABM lake fills and flows into Geona Creek.

There is a potential risk that initial treatment of ABM lake water using the methods described in Section 2.5.3 will not adequately decrease COPI concentrations, leading to WQOs being exceeded in the receiving environment. Monitoring of water quality in ABM lake, Geona Creek and Finlayson Creek will occur regularly throughout Active, Transition and Post-Closure. Unexpected water quality in Geona Creek and Finlayson Creek would trigger the applicable AMIs in the Project AMP, while unexpected water quality in ABM lake would trigger this AMI.

ABM lake is expected to take approximately 15 years to fill upon the cessation of Operations. It is expected that ABM lake water will have higher COPI concentrations during Active Closure and earlier years of Transition Closure, decreasing over time with submergence of Class A and Class B material, dilution and treatment. This AMI is only applicable in Post-Closure and in the final five years of Transition Closure, leaving enough time for additional or alternative treatment approaches to be implemented before ABM lake starts flowing to Geona Creek.

7.2.1.2 Narrative Response

ABM lake water has concentrations of COPIs that could lead to exceedance of WQOs in the receiving environment.

7.2.1.3 Indicators

The COPIs for which WQOs are developed (Ensero and Minnow, 2024) are used as indicators for this AMI:

- Anions and nutrients including ammonia-N, fluoride, nitrate, nitrite, and sulphate.
- Total aluminum, antimony, arsenic, cobalt, iron, nickel, selenium, thallium, and uranium.
- Dissolved cadmium, copper, lead, manganese, and zinc.

Alkalinity and pH are also included as additional indicators for the potential development of acidic drainage conditions.

7.2.1.4 Triggers and Action Levels

Action level triggers and numerical values are summarized in

Table 7-6 and Table 7-7. Low, moderate, and high action level triggers were calculated relative to Project WQOs for station KZ-37 on Geona Creek presented in Chapter 4 of the Water Management Plan (BMC, 2024f):

- Low trigger: 75% of COPI concentration equal to WQO;
- Moderate trigger: 85% of COPI concentration equal to WQO; and
- High trigger: 95% of COPI concentration equal to WQO.

Table 7-6: ABM Lake Water Quality Triggers and Action Levels

Action Level	Triggers ^a
Low	Two consecutive samples exceed the low triggers indicated in Table 7-7. If samples are collected weekly, the monthly average will be used for comparison with the AMP trigger; or Trend analysis (e.g., seasonal Mann-Kendall) using the past 5 years of data identifies a statistically significant (0.05) increasing trend in a COPI concentration that will exceed the high trigger within 3 years.
Moderate	Two consecutive samples exceed the moderate trigger indicated in Table 7-7. If samples are collected weekly, the monthly average will be used for comparison with the AMP trigger; or Trend analysis (e.g., seasonal Mann-Kendall) using the past 5 years of data identifies a statistically significant (0.05) increasing trend in a COPI concentration that will exceed the high trigger within 2 years.
High	Two consecutive samples exceed the high trigger indicated in Table 7-7. If samples are collected weekly, the monthly average will be used for comparison with the AMP trigger; or Trend analysis (e.g., seasonal Mann-Kendall) using the past 5 years of data identifies a statistically significant (0.05) increasing trend in a COPI concentration that will exceed the high trigger within 1 year.

^a For field pH and alkalinity, the trigger will occur if the sample result is below the trigger value.

Table 7-7: Water Quality Numerical Triggers for ABM Lake Water (KZ-38)

Constituent (unit: mg/L)	Low Trigger	Moderate Trigger	High Trigger
pH	6.5	6	5.5
Alkalinity	tbd ^a	tbd ^a	10
Ammonia-N (unionized)	Concentration in ABM Lake that the WQM calculates would result in the low trigger concentration at KZ-37. ^b	Concentration in ABM Lake that the WQM calculates would result in the moderate trigger concentration at KZ-37. ^b	Concentration in ABM Lake that the WQM calculates would result in the high trigger concentration at KZ-37. ^b

^b Numerical trigger value will be calculated when the ABM Lake AMI is brought into the Project AMP, using the WQM that has been updated and re-calibrated based on water quality monitoring results through Project Construction and Operations.

7.2.1.5 Approach to Trend Analysis

Trend analysis, used to identify statistically significant trends, is the basis of some triggers and action levels throughout this AMI. This analysis aims to account for seasonality that is often present in water quality data. For water quality parameters with seasonal variation, the seasonal Mann-Kendall test will be applied to determine statistically significant increasing or decreasing trends (i.e., $p < 0.05$). This test is commonly used to evaluate trends in water sample chemistry because it is designed for time series data and does not require such data to be normally distributed. For water quality data sets that have no clear evidence of seasonality, the (non-seasonal) Mann-Kendall or similar trend analysis test will be used. Where there are not yet enough data available to complete the trend analyses as specified, it may not be possible to identify statistically significant trends. During this period, only the sample-based triggers will be applicable.

7.2.1.6 Monitoring Requirements

The monitoring schedule proposed for ABM lake water is provided in Table 7-28.

7.2.1.7 Evaluation of Monitoring Results

Data review will occur after each sampling event, within two weeks of when the analytical results are received from the laboratory. The typical laboratory turn-around time for standard water quality analysis is two weeks. The evaluation will include a comparison of the water quality data to the AMI trigger values using EQWin environmental data management software, or similar, and the trend analysis will be carried out using Microsoft Excel spreadsheet software, or similar.

If an action level trigger has been reached, verification of the monitoring data will begin within two weeks of when the analytical results are received from the laboratory. This will include review of the laboratory QA/QC data, field QA/QC data, field notes, and historical data associated with the result. Laboratory re-analysis may be warranted pending findings from the data review.

If the data are confirmed as reaching a trigger, the station will be re-sampled within one month of receiving the analytical results from the laboratory, pending current site conditions (e.g., monitoring station may be frozen, dry, or inaccessible). Upon verification of the data following confirmatory sampling the next steps will be taken as outlined in the MRP described in Section 7.2.1.8.

7.2.1.8 Development and Implementation of Management Response Plan

The staged development and implementation of a Management Response Plan (MRP) is detailed in Table 7-8. Yukon Government and First Nations will be consulted prior to implementation of an MRP.

Table 7-8: ABM Lake Water Quality Staged Response to Trigger Activation

Action Level	Description of Management Plan Elements
Low	Assess and Define the Situation - Review water quality data to assess the potential impact of the trigger being reached. Add additional water quality monitoring station(s) or increase monitoring frequency, as required; - Review existing data and water quality models to determine the possible cause of the COPI concentration increases. Undertake detailed field investigation if additional data are required; - Prepare a preliminary MRP including re-evaluation of timelines and possible adjustment of low, moderate, and high action level triggers to ensure timely implementation of the MRP when required; - Identify personnel who will be responsible for key decisions related to the development/update and implementation of the MRP; and - Complete updates to the MRP following conclusion of any additional investigations.
Moderate	Design Preferred Mitigation Approach - Update the MRP to include a detailed evaluation of the mitigation options and selection of the preferred management response that will be implemented should the trend continue and high action level triggers be reached; - Design the preferred mitigation approach in sufficient detail to allow for successful implementation should the high action level be reached, including any required assessment and permitting; - Provide recommendations for monitoring that would be implemented to assess the effectiveness of the proposed mitigation and update the AMP as necessary; and - Implement appropriate mitigations, if any, to reverse water quality trends prior to reaching the high trigger.
High	Implement, Monitor, Evaluate, and Adjust - Implement the preferred mitigation approach; - Continue water quality monitoring and update the MRP to include any revisions or adjustments based on more recent information; - Evaluate the effectiveness of the implementation of the management response; and - Adjust the MRP and AMP as needed.

The following is a list of potential mitigation options that may be included in the MRP for ABM lake water quality:

- Conduct one or more additional rounds of treatment with organic carbon and/or ferric iron;
- Pump water to the existing WTP if it has not been decommissioned;
- Deploy a mobile WTP; and
- Broadcast lime to ABM lake for in situ metals removal.

The performance of the mitigation options will be measured by continuing the water quality monitoring program and reviewing indicator concentrations. The corrective action will be deemed successful once the objectives of the MRP are met.

7.2.1.9 Reporting Requirements

Annual AMP reports will be submitted as part of the Water Licence and the Quartz Mining License reporting. These reports will include the results of annual AMP reviews, summaries of AMP trigger events and responses, AMP updates and engagement activities.

Reporting of all trigger activations will be provided within one month of confirming the trigger, via Waterline.

7.3 UNDERGROUND MINE WORKINGS

Table 7-9 presents the closure objectives specific to the underground Mine workings, grouped by value categories (e.g., physical stability, chemical stability, health and safety, land use, etc.). This table also summarizes relevant design criteria and closure measures that have been developed to achieve the objectives, and performance criteria which will be used to define achievement of the objectives in Post-closure monitoring.

Table 7-9: Underground Mine Workings Closure Measures Summary

Value	Specific Closure Objective	Closure Performance Criteria	Closure Design Criteria/Closure Measures
Health and Safety	Reclamation of Mine openings and closure implementation avoids or minimizes adverse health and safety effects on the public, workers and wildlife.	No injuries or casualties as a result of interaction with closed Mine workings.	All underground working accesses are within the ABM open pit boundaries. Portal entrances will be backfilled to prevent access while the workings are flooded.
Land Use / Ecological Conditions and Sustainability	No active water treatment required to maintain chemical stability or environmental compliance.	Seepage from underground workings to ABM lake do not contribute to water management in Post-closure period.	Any seepage from underground workings will be captured and treated in the ABM lake during the Active Closure period.
Long-term Certainty	Minimize the need for long-term operations, maintenance and monitoring after reclamation activities are complete.	No long-term maintenance required for underground workings or openings.	Portals sealed with waste rock to prevent access during Active Closure/Transition Closure.

During the Active Closure period, or even prior to the completion of active surface mining, underground mining equipment and infrastructure will be removed, including dewatering equipment. The portal entrances will be closed and secured to prevent access to the portals and underground workings as they slowly flood during the Active and Transition Closure periods.

The portal entrances to the underground Mine are within the ABM open pit and will therefore, in Closure, become part of the ABM lake when flooded.

7.4 WASTE ROCK AND TAILINGS STORAGE FACILITIES

7.4.1 Class A Storage Facility

An alternatives assessment was undertaken to review, evaluate, and select a preferred waste rock and tailings management strategy (Section 2.4). The assessment determined that a co-disposal filtered tailings and waste rock facility located on the hillside to the west of Geona Creek in the Project Area was the preferred strategy for tailings and waste rock management and is referred to as the Class A Storage Facility.

The Class A Storage Facility is located on the western Geona Creek valley slope, with the majority of the Storage Facility slope facing northeast. The key Class A Storage Facility specifications are provided in Table 7-10. The cover will be installed progressively during Operations as each stage is completed. Details on the revegetation plan for this facility are presented in Section 7.1.

Table 7-10: Class A Storage Facility Designed Physical Specifications

Parameter	Class A Storage Facility
Elevation	1,400 masl to 1,495 masl
Aspect	Northeast
Final Surface Area (m ²)	740,000 m ²
Overall Slope	4H:1V
Bench Height (m)	n/a
Estimated Storage Capacity (Mm ³)	14 Mm ³

Table 7-11 presents the closure objectives specific to the Class A Storage Facility, grouped by value categories (e.g., physical stability, chemical stability, health and safety, land use, etc.). This table also summarizes relevant design criteria and closure measures that have been developed to achieve the objectives, and performance criteria which will be used to define achievement of the objectives in Post-closure monitoring.

Table 7-11: Class A Storage Facility Closure Summary

Values	Specific Closure Objective	Closure Performance Criteria	Closure Design Criteria/Closure Measures
Physical Stability	Ensure long-term physical stability to minimize erosion, subsidence and slope failure	No signs of gully erosion or slope creep Geotechnical monitoring program does not return unacceptable levels of slope movement	Facility constructed at maximum 4H:1V overall slope. Buttress constructed at maximum 3H:1V overall slope. Engineered composite cover includes an 80 mil, textured HDPE geomembrane overlaying a approximately 0.5 m layer of compacted glacial till. Covered with a minimum of 3.0 m Class C material, approximately 0.3 m of growth media. Buttress constructed at toe of facility with Class C material. Selection of appropriately graded material for placement in the lower slope region to manage interflow waters and prevent excessive buildup of pore water pressure. Progressive reclamation will limit surface area exposed to erosional forces and will establish erosion control (revegetation) on reclaimed surfaces. Revegetation prescription and methods consider ecosystem unit and cover material properties to minimize erosion/slope failure potential.
	Able to withstand seismic events and severe climatic conditions	No significant failure of facility.	Facility located on stable foundation. Foundation material inspected by geotechnical engineer and unsuitable material to be removed and stored in the Overburden Stockpile. Minimum Factor of Safety (FOS): Static 1.5, seismic 1.0. Buttress constructed at toe of facility with Class C material to improve physical stability. Overburden material beneath buttress stripped to bedrock. Engineered cover system with waste rock layer for frost protection and improved physical stability.

Values	Specific Closure Objective	Closure Performance Criteria	Closure Design Criteria/Closure Measures
Chemical Stability	Seepage volumes from the facility are minimized	Seepage quantity will be at or below predicted volumes.	Encapsulation of materials provided by engineered composite liner and cover systems (compacted glacial till and 80 mil, textured HDPE geomembrane). Progressive reclamation minimizes infiltration. Engineered composite cover and liner systems leakage is expected to range from 0.002 to 0.007 L/s.
	Ensure long-term chemical stability such that runoff and seepage quality is acceptable, without long-term reliance on active water treatment	Seepage quality will be at or below predicted COPI concentrations.	Encapsulation of materials provided by engineered composite liner and cover systems (compacted glacial till and 80 mil, textured HDPE geomembrane). Active water treatment systems (WTP) maintained until performance criteria achieved. Passive treatment systems (constructed as a contingency) to yield water quality acceptable for discharge in long term.
Land Use / Ecological Conditions and Sustainability	Restored capability for use by wildlife and TLU, and conditions are typical of surrounding area	The following ecosystem attribute variables are similar to control sites: Diversity – Richness and abundance of different functional groups Vegetation structure – cover and biomass Ecological processes – nutrient availability and seedling density Monitoring transects indicate signs of use by wildlife (e.g., sightings, browse, scat, burrows, trails) similar to control sites	Facility design maintains natural slopes, aspect and elevations, similar to surrounding area. Revegetation planned and executed in consideration of pre-existing vegetation communities and final facility features (elevation, slope, aspect) to maximize revegetation success and use by wildlife.
Financial Considerations / Long-term Certainty	Minimize outstanding liability and risks in Post-closure, and minimize the need for long-term operations, maintenance and monitoring in Post-closure	Monitoring surveillance and adaptive management programs are executed as planned without increasing maintenance demands	Facility constructed at maximum 4H:1V overall slope. Buttress constructed at maximum 3H:1V overall slope. Engineered composite cover with a minimum 3.0 m Class C material frost protection layer, and approximately 0.30 m growth media. Facility is designed for closure, minimal re-grading required at closure. Progressive reclamation minimizes reclamation work required at end of Operations. Design/location minimizes long-term risk associated with subsidence.

7.4.1.1 Closure Measures

The main components of the Class A Storage Facility cover system include:

- A surface layer of approximately 0.30 m growth media from local topsoil and overburden to support revegetation, which will be graded at surface to blend with the natural topography;
- A minimum of 3.0 m of Class C waste rock as a frost protection layer, to limit erosion, and improve physical stability of the facility;

- A minimum of 0.50 m of crushed Class C material placed above an 80 mil textured HDPE geomembrane; and
- A layer of approximately 0.50 m of compacted glacial till placed on the Class A tailings and waste rock material.

A summary of the cover material types and volumes, is provided in Table 7-12.

Table 7-12: Class A Storage Facility Cover Specifications

Cover Layer	Material Type	Thickness (m)	Approximate Volume (m ³)
Growth Media	Topsoil/Overburden Blend	~0.30	265,000
Frost Protection	Class C Waste Rock	Minimum 3.0	2,218,000
Liner Protective Layer	Zone F Material	~0.5	370,000
Geomembrane	Textured 80 mil HDPE	n/a	n/a
Compacted glacial till material	Glacial till	~0.5	370,000

Figure 7-4 presents the schematic of the composite cover system design for the Class A Storage Facility. To achieve infiltration performance of this cover system in the long-term, regular maintenance will be conducted on the cover. Monitoring will also be conducted to ensure the performance criteria are being met. Any contact water (runoff and seepage) with Class A material will report to the Class A Storage Facility Collection Pond via collection ditches and be treated at the WTP during Operations and Active Closure and until cover performance has been achieved. Details on the revegetation plan for this facility are presented in Section 7.1.

7.4.2 Class B Storage Facility

The Class B Storage Facility is located on the western Geona Creek valley slope, with the majority of the facility facing east. The facility is designed with an overall grade of 3H:1V with a crest elevation of 1,565 masl. The key Class B Storage Facility specifications are provided in Table 7-13.

Table 7-13: Class B Storage Facility Designed Physical Specifications

Parameter	Class B Storage Facility
Elevation	1,425 to 1,565 masl
Aspect	East
Final Surface Area (m ²)	700,500 m ²
Overall Slope	3H:1V
Bench Height (m)	15 m
Estimated Storage Capacity (Mm ³)	21 Mm ³

Table 7-14 presents the closure objectives specific to the Class B Storage Facility, grouped by value categories (e.g., physical stability, chemical stability, health and safety, land use, etc.). This table also summarizes relevant design criteria and closure measures that have been developed to achieve the

objectives, and performance criteria which will be used to define achievement of the objectives in Post-closure monitoring.

Table 7-14: Class B Storage Facility Closure Summary

Values	Specific Closure Objective	Closure Performance Criteria	Closure Design Criteria/Closure Measures
Physical Stability	Ensure long-term physical stability to minimize erosion, subsidence and slope failure.	No signs of gully erosion or slope creep. Geotechnical monitoring program does not return unacceptable levels of slope movement.	Facility constructed at maximum 3H:1V overall slope. Cover includes composite compacted glacial till and 80 mil, textured HDPE geomembrane. Covered with a minimum of 3.0 m Class C material and approximately 0.3 m growth media. Revegetation prescription and methods consider ecosystem unit and cover material properties to minimize erosion.
	Able to withstand seismic events and severe climatic conditions.	No significant failure of facility.	Facility located on stable foundation – unsuitable overburden removed and till foundation. Minimum FOS: Static 1.5, Seismic 1.0.
Chemical Stability	Seepage volumes from the facility are minimized.	Seepage quantity will be at or below predicted volumes.	Cover and liner systems include composite compacted glacial till and 80 mil, textured HDPE geomembrane. Engineered composite cover and liner systems leakage is expected to range from 0.002 to 0.007 L/s.
	Ensure long-term chemical stability such that runoff and seepage quality meets water quality criteria, without long-term reliance on active water treatment.	Seepage quality will be at or below predicted concentrations.	Cover and liner systems include composite compacted glacial till and 80 mil, textured HDPE geomembrane. Facility covered with low permeability cover system. Passive treatment systems (constructed as a contingency) to yield water quality acceptable for discharge in long-term.
Land Use / Ecological Conditions and Sustainability	Restored capability for use by wildlife and TLU, and conditions are typical of surrounding area	The following ecosystem attribute variables are similar to control sites: Diversity – Richness and abundance of different functional groups Vegetation structure – cover and biomass Ecological processes – nutrient availability and seedling density Monitoring transects indicate signs of use by wildlife (e.g., sightings, browse, scat, burrows, trails) similar to control sites	Facility design maintains natural slopes, aspect and elevations, similar to surrounding area. Revegetation planned and executed in consideration of pre-existing vegetation communities and final facility features (elevation, slope, aspect) to maximize revegetation success and use by wildlife.
Financial Considerations /	Minimize outstanding liability and risks in Post-closure, and minimize the need for long-term	Monitoring surveillance and adaptive management programs	Facility constructed at maximum 3H:1V overall slope.

Values	Specific Closure Objective	Closure Performance Criteria	Closure Design Criteria/Closure Measures
Long-term Certainty	operations, maintenance and monitoring in Post-closure	are executed as planned without increasing maintenance demands	Facility covered with compacted glacial till, 80 mil, textured HDPE geomembrane, minimum 3.0 m Class C material, and approximately 0.3 m growth media. Facility is designed for closure, minimal re-grading required at closure. Design/location minimizes long-term risk associated with subsidence.

7.4.2.1 Closure Measures

The main components of the Class B Storage Facility cover system include:

- A surface layer of approximately 0.3 m of growth media to support revegetation, which will be graded at surface to blend with the natural topography;
- A minimum of 3.0 m of Class C waste rock to act as a frost protection layer, to limit erosion, and to improve physical stability of the facility;
- A minimum of 0.5 m of crushed Class C material placed above an 80 mil, textured HDPE geomembrane; and
- Approximately 0.5 m of compacted glacial till placed above the Class B waste rock material.

During Closure, the cover system will shed surface water for collection in the Class B Collection Pond or to the environment once monitoring demonstrates it is acceptable for discharge. A summary of the cover design is provided in Table 7-15.

Table 7-15: Class B Storage Facility Cover Specifications

Cover Layer	Material Type	Thickness (m)	Approx. Volume (m ³)
Growth Media	Topsoil/Overburden Blend	~0.30	205,000
Frost Protection	Class C Waste Rock	Minimum 3.0	2,020,000
Liner Protective Layer	Zone F Material	~0.5	337,000
Geomembrane	Textured 80 mil HDPE	n/a	n/a
Compacted glacial till material	Glacial till	~0.5	337,000

Figure 7-4 shows a schematic of the composite cover system design for the Class B Storage Facility. Regular monitoring and maintenance will be conducted on the cover to achieve infiltration performance of this cover system in the long-term. Any contact water with the waste rock will remain separate from the clean surface run-off and be directed to the Class B Storage Facility Collection Pond during Active Closure and until cover performance has been achieved. During Active Closure, seepage will be directed to the WTP prior to release to the environment.

7.4.3 Class C Storage Facility

The Class C Storage Facility is located on the eastern Geona Creek valley slope, in a hanging valley. The key Class C Storage Facility design specifications are provided in Table 7-16.

Table 7-16: Class C Storage Facility Design Physical Specifications

Parameter	Class C Storage Facility
Elevation	1,450 to 1,530 masl
Aspect	West
Final Surface Area (m ²)	1,255,000 m ²
Overall Slope	3H:1V
Bench Height (m)	15 m
Estimated Storage Capacity (Mm ³)	41 Mm ³

Table 7-17 presents the closure objectives specific to the Class C Storage Facility, grouped by value categories (e.g., physical stability, chemical stability, health and safety, land use, etc.). This table also summarizes relevant design criteria and closure measures that have been developed to achieve the objectives, and performance criteria which will be used to define achievement of the objectives in Post-closure monitoring.

7.4.3.1 Closure Measures

The Class C Storage Facility will contain non-acid generating waste rock, and as such, a liner and/or cover that reduces net percolation and seepage is not required. The final cover for the Class C Storage Facility therefore includes:

- Approximately 0.30 m growth media to support revegetation.

This layer will be installed once the appropriate volume of waste has been stored in the facility as per the Mine Development and Operations Plan (BMC, 2024g).

Table 7-17: Class C Storage Facility Closure Summary

Values	Specific Closure Objective	Closure Performance Criteria	Closure Design Criteria/Closure Measures
Physical Stability	Ensure long-term physical stability to minimize erosion, subsidence and slope failure.	No signs of gully erosion or slope creep. Geotechnical monitoring program does not return unacceptable levels of slope movement.	Facility constructed at maximum 3H:1V overall slope. Facility covered with growth media. Revegetation prescription and methods consider ecosystem unit and cover material properties to minimize erosion.
	Able to withstand seismic events and severe climatic conditions.	No significant failure of facility.	Minimum FOS: Static 1.5, Seismic 1.0.
Chemical Stability	Ensure long-term chemical stability such that runoff and seepage quality meets water quality criteria, without long-term reliance on active water treatment.	Seepage quality will be at or below predicted concentrations.	By definition and design, facility contains only non-reactive (non-potentially acid generating, non-ML) waste rock. Contingency passive treatment systems (CWTS) to yield water quality acceptable for discharge in long-term.
Land Use	Restored capability for use by wildlife and TLU, and conditions are typical of surrounding area.	The following ecosystem attribute variables are similar to control sites: Diversity: Richness and abundance of different functional groups Vegetation structure: cover and biomass Ecological processes: nutrient availability and seedling density Monitoring transects indicate signs of use by wildlife (e.g., sightings, browse, scat, burrows, trails) similar to control sites.	Facility design maintains natural slopes, aspect and elevations, similar to surroundings. Revegetation planned and executed in consideration of pre-existing vegetation communities and final facility features (elevation, slope, aspect) to maximize revegetation success and use by wildlife.
Financial Considerations / Long-term Certainty	Minimize outstanding liability and risks in Post-closure, and minimize the need for long-term operations, maintenance and monitoring in Post-closure.	Monitoring surveillance and adaptive management programs are executed as planned without increasing maintenance demands.	Facility constructed at maximum 3H:1V overall slope. Facility covered with growth media. Facility is designed for closure, minimal re-grading required at closure. Design/location minimizes long-term risk associated with subsidence.

7.4.4 Overburden Stockpile

Overburden stripped from the ABM open pit excavation is required (in part) for Closure and will be placed in a stockpile along the Geona Creek valley's east slope, north of the Class C Storage Facility. At Closure, any remaining overburden will be recontoured and revegetated. Topsoil stockpile management is discussed in Section 7.1.2 in relation to retention of nutrients and seed stock for revegetation and is further described in the Sediment and Erosion Control Plan (BMC, 2024k).

7.5 ORE STOCKPILE AND PADS

Mined ore will be stored temporarily near the Process Plant at the toe of the Class B Storage Facility, at the ROM pad and LGO stockpile. Table 7-18 presents the closure objectives specific to the ROM pad and LGO stockpile, grouped by value categories (e.g., physical stability, chemical stability, health and safety, land use, etc.). This table also summarizes relevant design criteria and closure measures that have been developed to achieve the objectives, and performance criteria, which will be used to define achievement of the objectives in Post-Closure monitoring.

7.5.1 Closure Measures

ROM or LGO material that has not been processed will not require relocation at Closure, as the area is located within the Class B Storage Facility footprint and will be encapsulated within the cover and liner systems at Closure. Details are summarized in Table 7-18.

Table 7-18: Ore Stockpile and Pads Closure Summary

Value	Specific Closure Objective	Closure Performance Criteria	Closure Design Criteria/Closure Measures
Physical Stability	Ensure long-term physical stability to minimize erosion, subsidence and slope failure.	No signs of gully erosion or slope creep.	Features will be re-graded to promote positive drainage, if required, and covered with approximately 0.3 m growth media and revegetated, as part of the Closure cover system for the Class B Storage Facility.
Chemical Stability	Ensure long-term chemical stability such that runoff and seepage quality meets water quality criteria, without long-term reliance on active water treatment.	Water quality objectives and/or effluent quality standards are not exceeded due to contributions from pad runoff/seepage.	Active water treatment systems maintained until performance criteria are achieved, as per requirements for the Class B Storage Facility
Land Use	Restored capability for use by wildlife and TLU, and conditions are typical of surrounding area.	The following ecosystem attribute variables are similar to control sites: Diversity: richness and abundance of different functional groups. Vegetation structure: cover and biomass. Ecological processes: nutrient availability and seedling density. Monitoring transects indicate signs of use by wildlife (e.g., sightings, browse, scat, burrows, trails) similar to control sites.	Features will be reclaimed to maintain natural slopes, aspect and elevations, similar to surrounding area. Revegetation planned and executed in consideration of pre-existing vegetation communities and final facility features (elevation, slope, aspect) to maximize revegetation success and use by wildlife.
Financial Considerations / Long-term Certainty	Minimize outstanding liability and risks after reclamation activities are complete.	Closure risk assessment does not identify any moderate/high risks associated with pads.	Any remaining ore will be encapsulated within the liner and cover systems of the Class B Storage Facility (which is the same as the Class A Storage Facility).

7.6 WATER MANAGEMENT STRUCTURES AND SYSTEMS

Table 7-19 presents the closure objectives specific to the water management structures and systems, grouped by value categories (e.g., physical stability, chemical stability, health and safety, land use, etc.). This table also summarizes relevant design criteria and closure measures that have been developed to achieve the objectives, and performance criteria that will be used to define achievement of the objectives in Post-closure monitoring.

Table 7-19: Water Management Structures and Systems Closure Summary

Value	Specific Closure Objective	Closure Performance Criteria	Closure Design Criteria/Closure Measures
Physical Stability	Closure water management facilities are physically stable and performing in accordance with designs.	No major repairs required due to instability of water management structures.	Not applicable; all ponds, collection ditches and diversion channels are removed in Post-closure.
	Able to withstand seismic events and severe climatic conditions.	No significant failure of facility.	Not applicable; all ponds, collection ditches and diversion channels are removed in Post-closure.
Health and Safety	Reclamation eliminates or minimizes existing hazards to the health and safety of the public, workers and area wildlife by achieving conditions similar to local area features.	No significant injuries or casualties to humans or wildlife due to water collection, conveyance or passive treatment systems.	Site runoff patterns returned to pre-mining patterns/channels where possible/practicable.
Land Use	Reclamation and closure activities protect the aquatic, terrestrial and atmospheric environments from Mine-related degradation and restore environments that have been degraded by Mine-related activities.	Effluent Quality Standards will apply at final discharge locations during all closure periods. Water Quality Objectives at key receiving environment locations during all closure periods.	Operational waste rock management and Mine waste facility design (e.g., filtered tailings, stacked out of watercourse) designed to meet Closure principles of reducing impacted water and controlling sources and COPI mobilization. Composite cover and liner systems for the Class A and Class B Storage Facilities will minimize COPI mobilization. ABM lake treatment system will provide primary and secondary treatment of COPI concentrations prior to discharge from Project area.
Financial Considerations / Long-term Certainty	The need for long-term operations, maintenance and monitoring after reclamation activities are complete is minimized, and no active water treatment is required to achieve closure objectives.	Maintenance and monitoring efforts and durations do not significantly exceed planned levels. Active water treatment is maintained only during Active Closure and Transition Closure period as contingency.	No classified water-retaining dams (CDA, 2013 and 2014) will remain on site in the Post-closure Period. Drainage and conveyance networks are passive and mimic pre-mining patterns. Water treatment in Post-closure is passive in design.

7.6.1 Closure Water Quality Objectives

WQOs have been developed for the COPIs associated with the Project, listed in Table 7-20 and Table 7-21. Details of the methodology used to derive the WQOs are summarized in the Water Management Plan (BMC, 2024f) and detailed in Ensero and Minnow (2024). The development of the WQOs used a consistent framework that included the adoption of generic guidelines for the Project, the identification of COPIs, the evaluation of potential approaches to developing WQOs and Site Specific Water Quality Objectives Water Quality Objectives, and the derivation of WQOs based on CCME, BC ENV and Federal Water Quality Guidelines (FWQG) and Site Specific Water Quality Objectives Water Quality Objectives.

Table 7-20: KZK Water Quality Objectives Based on CCME and BC ENV Guidelines

Constituent	CCME Guideline Date	BC ENV Guideline Date	FWQG Guideline Date	Generic Guideline used for WQOs
Ammonia-N, unionized	2010	Not available	Not available	0.016 mg/L
Aluminum, total	1987	2023	2022	$(e^{[0.645 \ln(DOC)] + [2.255 \ln(hardness)] + [1.995 \cdot pH]} + [-0.284 \cdot (\ln(hardness) \cdot pH)] - 9.898) / 1000$ (mg/L) for hardness from 10 to 430 mg/L, pH from 6 to 8.7, and DOC from 0.08 to 12.3 mg/L
Antimony, Total	Not available	2023	Not available	0.074 mg/L
Cobalt, Total	Not available	2004	2017	$e^{[(0.414 \ln(hardness)) - 1.887]} / 1000$ mg/L for hardness between 52 and 396 mg/L.
Cyanide, Weak Acid Dissociable	Not available	1986	Not available	0.005 mg/L
Nickel, Total	1987	1987	Not available	0.025 mg/L if hardness (as CaCO ₃) ≤ 60 mg/L or unknown, $(e^{[0.76 \ln(hardness)] + 1.06}) / 1000$ mg/L if hardness > 60 mg/L and ≤ 180 mg/L, 0.15 mg/L if hardness > 180 mg/L
Nitrate-N	2012	2009	Not available	3 mg/L
Nitrite-N	1987	1988	Not available	0.06 mg/L
Selenium, Total	1987	2014	Not available	0.002 mg/L
Sulphate	Not available	2013	Not available	128 mg/L if hardness ≤ 30 mg/L; 218 mg/L if hardness > 30 mg/L and ≤ 75 mg/L; 309 mg/L if hardness > 75 mg/L and ≤ 180 mg/L; 429 mg/L if hardness > 180 mg/L and ≤ 250 mg/L
Thallium, total	1999	No final guideline	Not available	0.0008 mg/L
Uranium, Total	2011	No final guideline	Not available	0.015 mg/L
Cadmium, Dissolved	Not available	2015	Not available	$(e^{(0.736 \ln(hardness) - 4.943)}) / 1000$ mg/L for hardness between 3.4 and 285 mg/L; WER multiplier of 2.9 applied to guideline in May
Copper, Dissolved	Not available	2019	2021	Biotic Ligand Model derived guideline based on temperature, pH, hardness, and DOC inputs; SSWQO applies in selected winter months for KZ-15 (0.00117 mg/L; Jan to Mar) and KZ-15 (0.00134 mg/L; Nov to Apr)

Constituent	CCME Guideline Date	BC ENV Guideline Date	FWQG Guideline Date	Generic Guideline used for WQOs
Lead, dissolved	Not available	Not available	2020	$(e^{(0.514[\ln(\text{DOC})]+0.214[\ln(\text{Hardness})]+0.4152)})/100$ 0 mg/L for DOC between 0.5 and 31.5 mg/L and hardness between 5 and 511 mg/L
Manganese, Dissolved	2019	Not available	Not available	Online CCME calculator that is hardness and pH dependent for hardness ≥ 10 mg/L and ≤ 670 mg/L, and pH 5.4-9.0
Zinc, Dissolved	2018	2023	Not available	$(e^{(0.947[\ln(\text{hardness mg/L})] - 0.815[\text{pH}] + 0.398[\ln(\text{DOC mg/L})] + 4.625)}/1000)$ mg/L. The equation is valid between hardness 23.4 and 399 mg CaCO ₃ /L, pH 6.5 and 8.13 and DOC 0.3 to 22.9 mg/L

Green shading indicates guideline selected for water quality objective

Table 7-21: KZK Site Specific Water Quality Objectives

Constituent	Site Specific Water Quality Objectives (mg/L)			
	KZ-13	KZ-37	KZ-15	KZ-26
Arsenic, Total	0.037	0.037	0.037	0.037
Iron, Total	0.36	0.91	0.32	0.81
Fluoride	1.1	1.1	1.1	1.1
Selenium, Total	0.002 mg/L at sulphate ≤ 60 mg/L; and $(0.1736 * [\text{sulphate}]^{0.597})/1000$ (mg/L) at sulphate > 60 mg/L			
Copper, Dissolved	See Table 7-20	0.00134 mg/L Nov to Apr; FWQG in Table 7-20 for other months	0.00117 mg/L Jan to Mar; FWQG in Table 7-20 for other months	See Table 7-20

7.6.2 Closure Measures

7.6.2.1 Predicted Water Quality Performance During Closure Periods

A water quality model was developed for the Project to estimate the water quality in Mine discharge and receiving waters and to help guide water management for the Project with respect to water quality (Ensero, 2024). Water quality modelling was performed on a monthly time step throughout the Project life to estimate seasonal variation. Additionally, three different precipitation scenarios were run to undertake a sensitivity analysis:

- Mean annual precipitation (i.e., an “average” year);
- One in 50 (1/50) wet year; and
- One in ten (1/10) dry year.

Estimates of water quality for a range of COPI including fluoride, antimony, arsenic, cadmium, uranium, selenium, and zinc were produced at key monitoring locations on site and in the downstream receiving environment, which includes:

- ABM lake;
- Geona Creek (receiving environment monitoring station KZ-37);

- Upper and lower Finlayson Creek (sites KZ-15 and KZ-26, respectively); and
- South Creek (KZ-13).

It must be emphasized that this predictive modelling can only predict a range of concentrations and, in some cases, relative changes in concentrations or loadings. The water quality modelling is attempting to simulate a range of complex natural processes that have inherent variability. This modelling is useful to understand the potential range of controls that are needed to safely meet the closure objectives and, in addition, to identify the monitoring program during Operations and after Post-closure that will provide information to update this modelling and the environmental controls required.

During the Active and Transition Closure phases, COPI concentrations in South Creek (KZ-13) were estimated to return to baseline levels as the Fault Creek diversion is removed, allowing South Creek to revert to its pre-Project flow regime. Elsewhere, COPI concentrations in the Geona and Finlayson Creek receiving environments increased during the Active Closure phase due to drain-down of the Class A and B Storage Facilities. During the Active and Transition Closure phases water from the drain-down of these facilities will be treated to meet WQOs. No COPI exceedances were estimated in Finlayson Creek or South Creek during the Active and Transition Closure phases.

During the Active and Transition Closure phases, flooding of the ABM open pit will occur due to the cessation of local groundwater dewatering and the removal of the Fault Creek diversion. It is anticipated that the ABM open pit will take 15 years to fill before the ABM lake overflows into Geona Creek. Modelling suggests that the ABM lake will, without treatment, contain elevated concentrations of antimony, arsenic, cadmium, copper, lead, selenium, uranium, and zinc due to solubilization of the load accumulated on the pit floor and walls; however, in situ treatment of the ABM lake is anticipated to significantly lower the concentrations of these elements. Table 7-22 provides a summary of the modelled water quality of ABM lake with and without in situ treatment.

Outflow from ABM lake marks the start of the Post-closure phase, resulting in increases in some COPI concentrations in Geona Creek. A marginal exceedance of the arsenic WQO was estimated to occur in one month of the year in Geona Creek. Aside from the marginal exceedance of arsenic, no other exceedances of the WQOs were estimated for any other constituent in Geona Creek, Finlayson Creek or South Creek during Post-closure in the precipitation scenarios evaluated with mitigation measures in place.

Table 7-22: Modelled Water Quality of ABM Lake: With and Without in situ Treatment

Constituent	Units	Initial ABM Lake Chemistry at time of overflow into Geona Creek	ABM Lake Chemistry After In Situ Treatment at time of overflow into Geona Creek
Sulphate	mg/L	230	210
Hardness (as CaCO ₃)	mg/L	410	410
Nitrate-N	mg/L	0.28	0.028
Nitrite-N	mg/L	0.02	0.02
Ammonia-N	mg/L	0.22	0.11
Fluoride	mg/L	0.21	0.21
Antimony, Total	mg/L	0.014	0.0067
Arsenic, Total	mg/L	0.083	0.083
Calcium, Total	mg/L	120	120
Cobalt, Total	mg/L	0.005	0.005
Iron, Total	mg/L	1.5	0.15 ^a
Lead, Total	mg/L	0.041	0.004
Nickel, Total	mg/L	0.014	0.014
Selenium, Total	mg/L	0.011	0.0027
Thallium, Total	mg/L	0.0011	0.0011
Uranium, Total	mg/L	0.045	0.022
Aluminum, dissolved	mg/L	0.075	0.075
Cadmium, dissolved	mg/L	0.0062	0.00061
Copper, dissolved	mg/L	0.033	0.0016
Manganese, dissolved	mg/L	1.1	0.63 ^b
Zinc, dissolved	mg/L	0.82	0.081

^a Although iron is oversaturated with respect to ferrihydrite (Fe(OH)₃) under oxidizing conditions which are expected as ABM Lake forms, in situ treatment will promote reducing conditions under which ferrihydrite and poorly crystalline iron oxyhydroxide minerals will dissolve. Therefore, to remain conservative, the model-estimated iron concentrations were reduced by an order of magnitude but not to the iron concentration at equilibrium with ferrihydrite.

^b Manganese concentration in equilibrium with rhodochrosite (MnCO₃).

7.6.2.2 Embankments and Ponds

The UWMP and LWMP and associated embankments will be decommissioned during Active Closure. Decommissioning will include removal of HDPE geomembranes, scarifying the disturbed surface areas, revegetating the pond areas, and re-establishing Geona Creek.

The Class C Storage Facility Collection Pond will be decommissioned during the Transition Closure period once the revegetated cover has been determined to be stable in the long-term. Following the revegetation of the Overburden Stockpile, and the area deemed stable from erosion, the Overburden Stockpile Collection Pond will be decommissioned.

Following the cessation of mining, the Pit Rim Pond will be decommissioned. Decommissioning of the Pit Rim Pond will include removal of the HDPE geomembrane, scarifying the surface and revegetating the pond area.

The Class A Storage Facility Collection Pond will be decommissioned following the determination that the cover is meeting its design criteria. The Class A Storage Facility Collection Pond will be decommissioned by removing the HDPE geomembrane, scarifying the surface and revegetating the pond area.

The Class B Storage Facility Collection Pond will be decommissioned as a water collection feature following the determination that the cover is meeting its design criteria. Upon the determination that the Class B Storage Facility water quality is stable in the long-term, the pond will be decommissioned by removing the HDPE geomembrane, scarifying the surface and revegetating the pond area.

7.6.2.3 Water Conveyance Systems

Temporary (Operations) water conveyance structures, including diversions, such as the Fault Creek diversion, will be removed at the cessation of mining. The decommissioning of the Fault Creek diversion and diversion ditches will redirect water back into the Geona Creek catchment and will contribute to the ABM open pit sub-catchment.

Surface water flows will be conveyed within the Mine footprint, and will exit the site in a controlled, stable fashion during Active Closure. This will be accomplished by maintaining diversions to reduce infiltration and erosion of reclaimed areas. Diversions will be maintained during Transition Closure to minimize contact of surface flow with Mine influenced soils. Modifications will be completed to flow patterns to achieve enhanced stability or accommodate water quality objectives during Transition Closure as Mine features are reclaimed (e.g., Class A Storage Facility, Process Plant). As an example, portions of the northwest diversion will be decommissioned in stages as the Mine features along the western side of the Geona Creek valley have been successfully reclaimed to return drainages to pre-mining conditions to the extent possible.

7.6.2.4 Active Water Treatment Systems

The Class A and Class B Storage Facility collection ponds will be pumped to the WTP throughout the Active Closure period and into the Transition Closure period until such time that the waste rock covers have been established. Once the Class A and Class B Storage Facility cover systems have been determined to meet their design criteria, the Class A and Class B Storage Facility collection ponds will be reclaimed and water will be passively released to Geona Creek if the water quality is deemed suitable.

Once water from the Class A and Class B Storage Facilities is released to Geona Creek, the WTP will be placed on standby, but available to treat water if required for the remainder of the Transition Closure period.

As the ABM open pit fills, lime, ferric iron and carbon sources will be added as required as described in Section 7.2 to treat the water as the ABM lake is formed. Once the ABM lake reaches 1,380 masl it

will begin to spill through the constructed wetlands and discharge to Geona Creek. The pipeline from the ABM open pit to the WTP will remain in place until it has been determined that the ABM lake does not require active treatment. Once the Project is determined to be geochemically stable, the active WTP will be decommissioned. Sludge produced from the active WTP during all Closure phases will be placed into the ABM open pit, which will provide additional alkalinity to the water.

7.7 OTHER MINE INFRASTRUCTURE

7.7.1 Closure Objectives and Criteria

The general objectives guiding the decommissioning of other Project infrastructure are to:

- Remove potential sources of environmental contamination and minimize erosion;
- Minimize safety risks to people and wildlife;
- Reclaim the site to an aesthetically acceptable level; and
- Develop habitat that will encourage future use by wildlife and land users.

Table 7-23 summarizes the specific closure objectives, performance and design criteria and closure measures related to the decommissioning of the Project mining, processing, and support infrastructure.

Table 7-23: Mine Infrastructure Closure Summary

Value	Specific Closure Objective	Performance Criteria	Design Criteria/Closure Measures
Physical Stability	All Mine-related structures and facilities are physically stable and performing in accordance with designs.	No signs of gully erosion or slope creep.	Features will be re-graded to promote positive drainage if required, covered with approximately 0.3 m growth media and revegetated.
Chemical Stability	Ensure long-term chemical stability such that surface water runoff and ground water quality is acceptable.	Surface water and ground water quality meets SSWQO.	Identification and removal of any soils impacted by fuel or other contaminants. Impacted soil will be treated in the Land Treatment Facility.
Health and Safety	Reclamation eliminates or minimizes existing hazards to the health and safety of the public, workers and area wildlife by achieving conditions similar to local area features.	No buildings remaining on site. All concrete footings and slabs broken and buried. All mobile equipment and Process Plant equipment removed from site at end of Active Closure.	Demolition of buildings and revegetate and re-contour when applicable. Destroy concrete slab areas, re-contour and revegetate when applicable. Mobile equipment will be sold. Any material left unsold will be landfilled on site. Sell Process Plant equipment.
Land Use	Restored capability for use by wildlife and TLU, and conditions are typical of surrounding area.	The following ecosystem attribute variables are similar to control sites: Diversity: Richness and abundance of different functional groups. Vegetation structure: cover and biomass Ecological processes: nutrient availability and seedling density. Monitoring transects indicate signs of use by wildlife (e.g., sightings,	Areas re-graded to maintain natural slopes, aspect and elevations, similar to surrounding area. Revegetation planned and executed in consideration of pre-existing vegetation communities and final facility features (elevation, slope, aspect) to maximize revegetation success and use by wildlife.

Value	Specific Closure Objective	Performance Criteria	Design Criteria/Closure Measures
		browse, scat, burrows, trails) similar to control sites.	
	Prevent contaminated soils from damaging local environment.	Results of soil sampling programs within acceptable levels for COPI.	Treat or remove fuel impacted soils in the Land Treatment Facility. Place any soils contaminated with processing reagents into Class A Storage Facility.
Long-term Certainty	No active water management required to maintain physical or chemical stability, or environmental compliance.	Monitoring surveillance and adaptive management programs are executed as planned without increasing maintenance demands. Passive treatment systems treating water to acceptable levels, and all active water treatment equipment removed from site.	Remove temporary (Operations) structures including stream crossings and, diversions. Remove water treatment tanks, clarifier, reagent mixing system, piping and electrical /instrumentation equipment. The WTP will be maintained in operational form until water quality objectives can be achieved and maintained through the use of passive treatment systems.

7.7.2 Closure Measures

7.7.2.1 Mine Camp and Related Infrastructure

Closure measures include dismantling and removing camp buildings, trailers, and related infrastructure. All materials will be salvaged, recycled, or landfilled in the WMF, as appropriate. BMC will develop a QA/QC program to ensure that no materials that could cause future impacts to the receiving environment will be placed in the WMF. If materials to be landfilled cannot be disposed of in the WMF or Class A Storage Facility, they will be disposed of off-site in an appropriate landfill facility. The graded camp pad will be scarified and re-contoured as required to promote positive drainage, and suitably revegetated to provide erosion protection as well as to match the surrounding natural vegetation.

7.7.2.2 Process Plant, Warehouse, Administrative Complex, and Related Infrastructure

Closure measures for the Process Plant as well as the associated Warehouse and Administration Complex include dismantling and removing buildings, trailers, and related infrastructure. Prior to dismantling and removal, buildings will be inspected for hazardous materials. Any hazardous materials will be removed and disposed of either on or off site in an appropriate landfill or storage facility. Non-hazardous materials that have no salvage value will be disposed of in the approved landfill at the site. Additional information is provided in the Waste Management Plan (BMC, 2020j) and the Hazardous Materials Management Plan (BMC, 2020l).

Prior to disassembly, buildings will be stripped of all non-attached equipment and materials such as shelving units, office furniture, and equipment. Wherever feasible, materials with salvage value will be sold for its value. Modular prefabricated trailer style buildings will, wherever economically feasible, be removed from the site and sold for their salvage value. The remaining service piping, cabling and skirting lumber will be removed and disposed of as either scrap or as salvageable material. Rigid steel frame buildings will be dismantled on site with the support steel being sold for salvage value wherever economically feasible.

Closure measures for the Process Plant building include salvage and removal of the process equipment and dismantling of the building.

Above ground concrete footings, foundations, concrete floor slabs and below grade concrete foundations will be broken to allow percolation of water and covered with suitable growth media to support revegetation. These covered slabs will be seeded with an appropriate vegetation mix to establish vegetative growth over these areas.

Confirmatory sampling of the soils beneath the concrete footings, foundations and floor slabs will be undertaken prior to covering with growth media to check that migration of contaminants beneath the concrete has not occurred. The specifics of the density of sampling and the contaminants that will be analyzed will be confirmed during detailed Closure Planning prior to the commencement of Active Closure.

All equipment related associated with the Process Plant, Warehouse, Administrative Complex, and related infrastructure will be cleaned before removal from site.

The Process Plant area will be re-contoured as required to promote positive drainage, and suitably revegetated to provide erosion protection as well as to match the surrounding natural vegetation.

7.7.2.3 Fuel Storage Areas

Closure measures for fuel storage areas include draining tanks of any remaining fuel and salvaging or recycling as appropriate. The liners will be removed from the areas and disposed of in an appropriate landfill. Any fuel contaminated soils, as determined through an Environmental Site Assessment (following the *Yukon Contaminated Site Regulations* (Yukon Government, 2002)) will be excavated and disposed of in the Land Treatment Facility.

7.7.2.4 Sewage Treatment Plant

The sewage treatment plants will be decommissioned by draining and flushing any tanks and piping with clean water to remove any residual treatment sludge and effluent. Residual sludge and effluent will be transported off site. The plants will be disassembled and salvaged or recycled as appropriate.

7.7.2.5 Water Treatment Plant

The WTP will remain in place during the Active and Transition Closure periods while ABM lake treatment and the Class A and Class B Storage Facility cover systems are constructed. The WTP will be maintained in operational form until WQOs can be achieved and maintained.

Closure measures for the WTP include disconnection of piping and equipment, which will be salvaged or recycled as appropriate. The WTP building will be disassembled with any salvageable materials collected. Remaining material will be placed in the site landfill, or to an off site landfill facility.

7.7.2.6 Waste Management Facility

The WMF will receive solid waste throughout the Mine life. As such, it will not be closed until the Active Closure period has completed. A decommissioning plan will be submitted to YG for the WMF. Once approved, the facility will be closed with a growth media and the area will be revegetated.

The Land Treatment Facility is located within the WMF and is expected to be required for accepting contaminated soils. The facility will remain operational until such time as all soils requiring treatment are fully treated. As the volume and contamination level of soils to be treated cannot currently be defined, closure planning for the Land Treatment Facility will be developed and refined as the closure activities commence so as to match the volume and contamination level of soils to be treated. The Land Treatment Facility HDPE geomembrane will be disposed of in an off site facility at the time of decommissioning. The area will be regraded and revegetated to match the surrounding topography.

7.7.2.7 Bulk Explosives Facility

At closure, any unused explosives, magazines, and other equipment will be returned to their respective suppliers or otherwise disposed of. The prill and emulsion silos will be decommissioned and salvaged as appropriate. The parking garage will be dismantled and salvaged. Any fuel contaminated soils will be excavated and placed in the Land Treatment Facility. The area will be recontoured to match local topography and revegetated.

7.7.2.8 Mobile Equipment

Mobile equipment such as vehicles, compressors, mobile electricity generators, and self-contained storage tanks, will be decommissioned and removed from site for sale, salvage, or recycling as appropriate.

7.7.2.9 Truck Shop

Truck shop equipment will be decommissioned and salvaged or recycled as appropriate. The truck shop building will be dismantled, and materials salvaged or recycled as appropriate. Debris which cannot be salvaged will be placed in the site landfill for disposal. Concrete footings, foundations, and floor slabs will be broken to allow percolation of water and covered with suitable growth media to support revegetation. These covered slabs will be seeded with an appropriate vegetation mix to establish vegetative growth over these areas.

Confirmatory sampling of the soils beneath the concrete footings, foundations and floor slabs will be undertaken prior to covering with growth media to check that migration of contaminants beneath the concrete has not occurred. The specifics of the density of sampling and the contaminants that will be analyzed will be confirmed during detailed Closure Planning prior to the commencement of Active Closure.

7.8 HAZARDOUS MATERIALS

7.8.1 Closure Objectives and Criteria

The objective for hazardous materials management at closure is to remove all unnecessary hazardous materials off site to minimize liabilities. Specific objectives for hazardous materials management are described in the Hazardous Materials Management Plan (BMC, 2020I), and include:

- Maintain a register of all hazardous materials at site to ensure all materials are accounted for and removed;
- Ensure proper storage, handling, and transport to minimize the specific hazards associated with each material;
- Reuse and recycle all possible hazardous materials and return materials to vendors where possible to minimize waste;
- Collect and manage hydrocarbon contaminated soils in an on site Land Treatment Facility to the extent possible to minimize transportation and disposal costs and retain usable soils at site for reclamation;
- Incinerate used oil and fuel filters, and hydrocarbon-soaked absorbents where waste management permits allow; and
- Use only certified transportation companies and disposal facilities for hazardous materials.

A summary for management of hazardous materials on site in Closure is presented in Table 7-24.

Table 7-24: Hazardous Materials Closure Summary

Value	Specific Closure Objective	Performance Criteria	Design Criteria/Closure Measures
Health and Safety	Eliminate risk to human and wildlife health and safety.	No access to hazardous materials. No hazardous materials incidents or spills.	Remove all non-essential hazardous materials. Proper storage and handling for hazardous materials.
Land Use	Eliminate risk of hazardous materials spills.	No hazardous materials on site.	Incineration of hazardous wastes and residual ash disposed in the on site landfill. Remove all remaining hazardous materials from site using certified waste transport companies and disposal facilities.
Long-term Certainty	Eliminate risk of hazardous materials spills. No residual liabilities from hazardous materials.	No hazardous materials on site.	Incineration of hazardous wastes and residual ash disposed in the on site landfill. Remove all remaining hazardous materials from site using certified waste transport companies and disposal facilities.

7.8.2 Closure Measures

All hazardous materials will be removed from site at Closure. Table 7-25 lists the potential hazardous materials on site at Closure and handling requirements for disposal and or removal of each. Incompatible substances will be stored separately to prevent contamination, fires, explosions,

gaseous emissions, leaching or other discharges, or other dangerous conditions according to the Material Safety Data Sheets. Any unused hazardous materials will be returned to vendors or sold where possible. Some residual hazardous wastes can be incinerated on site, and the residual ash disposed of in the on site landfill. Residual hazardous materials will be transported off site by certified hazardous materials transport companies and disposed of at certified facilities. When transporting hazardous materials, the containers will be labelled following Canadian *Transportation of Dangerous Goods Regulations* (SOR/2008-34).

Table 7-25: Potential Hazardous Materials at Closure and Disposal Requirements

Hazardous Material	Removal / Disposal Requirements
Mill reagents (e.g., lime, flocculants, activators, depressants, collectors, frothers)	Return unused reagents to vendors. Transport residual reagents and containers to certified disposal facilities.
Explosives	Return to vendor or disposal as directed by licensed explosives contractor
Waste diesel / gasoline	Burned on site if permit allows.
Surplus Fuels	Transported off site and used elsewhere or sold.
Aviation fuel	Managed by air service contractors for use on other contracts.
Solvents and lubricants (e.g., paint thinners and strippers, varnishes, degreasing fluids, mineral spirits and petroleum distillates)	Shipped to licensed recycle and/or disposal facility.
Used oil (waste oil) and fuel filters	Incinerated on site under valid permit with ash disposed of in on site landfill or transported to used oil disposal facility.
Propane	Transported off site and used elsewhere or sold.
Compressed gas	Shipped to licensed recycle or disposal facility.
Waste antifreeze	Transported off site to licensed disposal facility or waste materials (such as absorbent pads) incinerated and ash disposed of in on site landfill.
Lead acid batteries	Stored appropriately on wooden pallets with plastic wrap and shipped to a licensed recycle or disposal facility.
Aerosol containers	Shipped to licensed recycle or disposal facility.
Medical wastes (e.g., syringes, bandages)	Collected in purpose-built sharps containers and incinerated.
Hydrocarbon and/or metal contaminated soils	Managed in on site Land Treatment Facility while the on site facility is permitted, then removal and disposal off site.

7.9 ROADS AND OTHER ACCESS

7.9.1 Closure Objectives and Criteria

Closure of the Access and Site Roads will be guided by the following objectives:

- Limited effect on wildlife, in particular caribou breeding and migration path (for the Access Road route); and
- Reclaim roads to limit negative mining legacy.

For the Access Road, success in meeting these objectives will be achieved when closure monitoring programs indicate that impacts to wildlife from the existence and use of the Access Road are not significant. In addition, that there are zero health and safety incidents or instances of impact to

company reputation and social licence from the post-closure condition (and use, if any) of the Access Road.

For Site Roads, successful closure will be realized through completing revegetation of all disturbed road ways into stable landforms.

7.9.2 Closure Measures

As noted in Section 2.3.1, some RRDC members requested that the Access Road not be reclaimed but left open for traditional land use purposes. BMC intends to close and reclaim the Access Road as required by the Access Road Lease, but will participate in multi-party discussions (i.e. RRDC, Yukon Government, stakeholders) on this matter as required.

Once a decision has been made to permanently close the road, BMC will:

- Inspect the road and identify any site-specific road closure requirements (including any terrain hazard areas that may need specific closure prescriptions);
- Prepare a detailed road reclamation and closure plan based on the condition of the road;
- Inspect the site during reclamation, Closure and Post-Closure to ensure the reclamation objectives have been met; and
- Provide final confirmation that all deactivation activities have been completed as described in the detailed road reclamation and closure plan.

A Qualified Professional will conduct this work, including either a Registered Forest Technician (RFT), Registered Professional Forester (RPF), Professional Engineer (PEng) or a Professional Geoscientist (PGeo) with experience in the subject matter.

During reclamation and closure activities, public access will be restricted to the same extent as it currently is. The security station and gate at the access to the road from the Robert Campbell Highway will be manned and maintained and only authorized vehicles will be allowed on the road. Over the winter period, if there are limited site operations, the gate will be locked. Post-closure the access restriction strategies may include additional gates, signs and barriers.

Road reclamation (for both the Access Road and all Site Roads) will involve the removal of the culverts and drainage structures and decommissioning of the roadbed. The roadbed will be contoured and rounded throughout its length, and will include the following activities:

- In smaller cuts and fills, ditches will be filled in, and the soils shaped to match the surrounding topography;
- In large cuts and fills, the embankment or excavation footprint will be reshaped to a lesser extent, but all slopes will be flattened or rounded to better suit the surrounding terrain; and

- Surfaces of gradients less than 25% will be scarified where necessary using scarifiers on bulldozers, excavators and graders to better accept seeding.

All culverts, bridges, and drainage structures will be removed and disposed of off site at an appropriate location. The following activities are planned:

- Trenches resulting from the removal of culverts will be swaled or contoured to match the surrounding terrain;
- Where warranted due to fine grain soils, erosion protection will be installed in the remaining swales, to a point where the reclaimed watercourse meets with its original path in undisturbed soil;
- If ditches are to be left intact (potentially required in steeper sections) existing ditch erosion protection may be left in place; and
- The bridge at km 17 will be removed, and the abutments will be excavated to the level of the rip-rap placed during construction.

All exposed soils along the length of the road will be stabilized and contoured to prevent surface erosion, then seeded with an appropriate seed mix (Section 7.1.2).

7.10 BORROW MATERIALS PLANNING

A preliminary investigation into available material for covers and construction purposes has been conducted. Table 7-26 presents the volumes of material for the cover systems described in Section 7.4.

Table 7-26: Borrow Materials and Volumes for Basins and Covers

Material Type	Source	Estimated Volume Required (m ³)	Estimated Volume Available (m ³)
Class C Waste Rock for Frost Protection for Class A and B Storage Facility	Class C Waste Rock from ABM open pit	4,238,000	41,300,000
Glacial Till for Class A Storage Facility	Overburden from ABM open pit and other site facilities	740,000	9,000,000
Glacial Till for Class B Storage Facility Cover System	Overburden from ABM open pit and other site facilities	674,000	9,000,000
Growth media for revegetation on Class A, Class B and Class C Storage Facilities	Topsoil and overburden from facility preparation	850,000	2,240,000

The estimated growth media volume available for reclamation is assumed to be a combination of topsoil as well as the upper layer of overburden. This material will be readily available for Closure as it will be excavated and stored next to the facilities, from where it was stripped, in topsoil stockpiles.

The Class C material required is based on a minimum 3.0 m thickness frost protection layer required for the Class A and Class B Storage Facility cover systems and may be tapered and increased for geotechnical stability.

The glacial till required to construct the engineered composite cover systems of the Class A and Class B Storage Facilities will be sourced from ABM open pit stripping and/or foundation clearing for other Project infrastructure that will be stored in the Overburden Stockpile during Operations.

7.11 MONITORING AND MAINTENANCE

The closure monitoring program builds on the operational monitoring program for the Project outlined in the Sediment and Erosion Control Plan (BMC, 2024k). The Active Closure period is expected to last approximately three years and will include regular monitoring, maintenance, and reporting in addition to monitoring plans developed in the execution plans for the closure components. The Transition Closure period lasts for a further approximately 12 years while the ABM lake fills. When monitoring has shown that closure performance criteria have been met, less frequent monitoring and maintenance will be required. Post-closure monitoring will last until all reclamation objectives are met.

It should be noted that the monitoring and maintenance plan presented here will be refined through Construction and Operations as new data are collected and programs change through adaptive management. Closure monitoring program updates will be discussed and agreed with Yukon Water Board, EMR, and Kaska as the Project moves into Closure. The term “monitoring” is used herein to describe both sampling activities and visual inspections.

This section discusses the monitoring activities that will continue during Active Closure, Transition Closure, and Post-closure to ensure reclamation objectives are met. The different components planned for monitoring during the closure periods are:

- Physical and chemical stability of engineered facilities;
- Surface and groundwater quantity and quality;
- Reclamation and wildlife use; and
- Aquatic resources (benthic invertebrates and fish).

The objectives of the monitoring programs are to:

- Provide qualitative and/or quantitative characterizations of important conditions over time through the various closure phases;
- Allow for the comparison of these conditions with performance criteria established to evaluate if closure measures are meeting identified closure objectives; and
- Allow for the comparison of these conditions with thresholds established in the Closure Adaptive Management Plan (Section 7.12.2).

Closure monitoring results and closure progress will be included in annual reporting to Yukon Water Board, EMR, RRDC, and LFN. Reporting will include:

- Presentation of monitoring results;
- A discussion of the effectiveness and success of reclamation;
- Development and implementation of supplemental or corrective measures to successfully reclaim sites where the initial measures were not successful (if any); and
- Identification and documentation of outstanding environmental issues along with, where warranted, the plans and a schedule for resolution. Issues that have been successfully mitigated will be listed as resolved.

7.11.1 Physical and Chemical Stability of Engineered Facilities

The Class A, Class B and Class C Storage Facilities must maintain physical and chemical stability in Closure to achieve the established objectives, as they will remain on site as engineered landforms. Natural processes such as wind and water erosion, settlement, and permafrost degradation can affect geotechnical stability, and by association, geochemical stability. The design criteria for the facilities are described in the Feasibility Design of Tailings Waste and Water Management Facilities Report (KP, 2019a), and include consideration for the facilities to be constructed, operated, and closed in a manner that will support this Closure objective of remaining on site as landforms.

The design engineers will specify and periodically update monitoring program(s) and action levels based on the performance of each structure during Construction, Operations and Closure as part of the Operations, Maintenance and Surveillance Manual(s) to be developed for the Project (and regularly updated throughout the Project life). The Operations, Maintenance and Surveillance Manual(s) will be reviewed by Kaska prior to it being finalized. Geotechnical monitoring will be performed annually and occur for the following facilities:

- Class A, B, and C Storage Facilities;
- Foundations of decommissioned Process Plant and infrastructure until fully reclaimed;
- Water collection ponds, spillways, and conveyance systems until fully decommissioned and reclaimed;
- Underground areas until all equipment and personnel are removed and flooding begins;
- ABM open pit ramp and walls until flooded; and
- Service and haul roads until open cross drains are constructed to convey water in original watercourses.

General monitoring activities for geotechnical physical stability will include:

- Completion of consistent monitoring records from established points of observation from Construction through to Post-closure; and

- Inspection for deformation of any of the facilities that could affect Closure objectives or criteria.

General monitoring activities for geochemical stability will include:

- Observations of changes that could indicate chemical instability (e.g., seeps and stains); and
- Sampling and testing (included in the water quality monitoring program).

There will be minimal maintenance required for infrastructure in Closure. Maintenance activities will include erosion control on slopes and debris removal from spillways, channels, and culverts.

Additional detail related to monitoring for the specific facilities is summarized in Table 7-27 and provided in the following sections.

Table 7-27: Summary of Closure Period Monitoring for Physical Stability of Engineered Facilities

Monitoring Program	Monitoring Locations	Timing	Active Closure	Transition Closure	Post -Closure
Physical Stability	Engineered facilities	Summer	Annual	Annual for Years 1 and 2, and every three years thereafter, assuming physical stability has been demonstrated.	1 per 5 Years

7.11.1.1 Engineered Facilities

The key objective of monitoring the engineered facilities is long-term physical and chemical stability. Monitoring of the Class A, B, and C Storage Facilities will occur biennially during Active Closure and once per three years during Transition Closure, with reduced frequency (initially once per five years) in Post-closure if previous monitoring provides sufficient evidence of stability.

Monitoring will be undertaken by suitably qualified professionals, and will include:

- Inspection and assessment of physical stability of the Class A, B, and C Storage Facilities;
- Inspection and assessment of geochemical performance of Class A and B Storage Facilities, including testing performance of cover and liner systems as necessary;
- Inspection of reclaimed Process Plant and ancillary facilities areas, and site roads to ensure slopes are stable and not eroding;
- Inspection of any remaining diversion ditches and berms;
- Inspection of ground conditions, such as possible effects of seasonal freeze/thaw and permafrost; and
- Identification and inspection of unanticipated seepage (including volume and quality).

Continuous monitoring equipment will be employed where necessary to assess physical stability of the Class A, B, and C Storage Facilities.

Monitoring instrumentation may include:

- Extensometers to measure axial displacement, which provides information on the displacement of the rock mass;
- Inclinometers to measure horizontal displacement; and
- Piezometers, such as vibrating wire piezometers, will allow for continuous monitoring of the pore-water pressure to determine the stability of slopes.

Photographic/satellite image analysis may also be used to monitor slope stability of the facilities.

7.11.1.2 ABM Open Pit

The key objectives for monitoring the ABM open pit in Closure are to check pit wall stability once dewatering has ended, and to manage water quality in the ABM lake in preparation for discharging to Geona Creek. A pit wall failure could produce waves in the ABM lake that might result in an uncontrolled release of water from the ABM open pit or result in physical mixing of the ABM lake strata that may adversely affect water quality. Risks and appropriate mitigation strategies, related to the ABM open pit and ABM lake in Closure are addressed in the FMEA included in Appendix A. Water quality monitoring will be conducted to ensure that mitigation measures are effective, and the ABM lake and releases meet required water quality criteria.

Monitoring of the ABM open pit during and after flooding will involve water quality and physical inspections to meet closure objectives and performance criteria. Activities for monitoring include:

- Monitoring geotechnical stability of the ABM open pit walls;
- Monitoring water level in the ABM lake during flooding and outflow rates once fully flooded;
- Water quality monitoring in the ABM lake through depth and at the discharge point once fully flooded; and
- Inspecting the integrity of barriers including the double perimeter berms and signage.

Water quality monitoring of the ABM lake will begin approximately one year after the ABM open pit has started to fill with water so as to allow safe access and water sampling by boat or other means. Separate samples will be collected at the surface (i.e., top 2 m), and mid depth, and at 5 m above the pit floor to assess how well mixed the ABM lake is and track the development of any stratification. Water quality data will inform any in situ treatment that may be necessary to limit the ABM lake metal concentrations.

The parameters measured in the water quality samples are the same as those listed for surface and groundwater monitoring in Section 7.11.2. The transition from Transition Closure to Post-closure is deemed to occur once the ABM lake starts to overflow. If stable water quality is observed, the sampling frequency will be reduced for the remainder of the Post-closure period.

7.11.2 Surface and Groundwater Monitoring

Water quality monitoring will be performed to determine the progress and efficacy of site reclamation to confirm that WQOs in the receiving environment are being met, and to identify whether any AMP triggers are met.

The surface and groundwater quality monitoring locations, frequencies, parameters and Quality Assurance and Quality Control (QA/QC) procedures for Operations are set out in detail in the EMSRP (BMC, 2024m). These will be revised for Active, Transition and Post-closure, as appropriate, as the EMSRP is a “living document”, and will continue to be revised, incorporating ongoing data collection and results and observations made during the Construction and Operations phases of the Project, and eventually be amended to be applicable for the Closure phases of the Project. One of the revisions that will be made for the Post-closure phase will be to compare the surface and groundwater to the Guidelines for Canadian Drinking Water Quality (Health Canada, 2020); this is a commitment BMC has made to Kaska.

Surface water quality monitoring will occur at the sites indicated in Figure 7-5, and details of the surface water quality monitoring schedule are included in Table 7-28. The automated surface water hydrometric stations in Geona Creek, Finlayson Creek and South Creek will also continue to be monitored during Closure. Adaptive management strategies may need to be implemented to reduce the effects from the reduction of flows and water levels in the receiving environment of South Lakes once Fault Creek is diverted back to Geona Creek. BMC has committed to developing these strategies (if required) in collaboration with Kaska.

Groundwater quality monitoring will occur at the sites indicated in Figure 7-6, and details of the groundwater quality monitoring schedule are included in Table 7-29.

KZ-9 Site to be discontinued once LWMP discharge feed station (KZ-8) is established during Operations.

W: Weekly; Wd: Weekly while discharging; Wnf: Weekly while not frozen; M: Monthly; Q: quarterly; Md: Monthly while discharging.

SA: two times each calendar year for the first three years and once per calendar year afterwards as per MDMER directive.

Field Parameters: In situ pH, temperature, conductivity, oxidation/reduction potential will be collected at all stations on the same monitoring frequency.

A: Physical parameters, conductivity, TSS, TDS, hardness, alkalinity, sulphate, ICP-total metals, ICP-dissolved metals.

N: Nutrients (Ammonia-N, Nitrate-N, Nitrite-N).

DOC: Dissolved organic carbon.

CN: Total and weak acid-dissociable cyanide.

Note: More frequent monitoring may be conducted to confirm efficacy of in situ ABM Lake treatment and/or if the AMP is triggered.

The ABM lake station will be split into two sub stations to allow for a monitoring location at surface and at least one additional location at depth in the lake (subject to stratification conditions of lake). Once sufficient open water is present in the ABM lake, the planned monitoring frequency will be monthly during Active Closure (when access is safe to do so) and for the first two years of Transition Closure and then quarterly thereafter. Additional monitoring on a weekly basis will be completed for four weeks following injection of in situ treatment reagents.

Table 7-29: Summary of Closure Period Monitoring for Groundwater

7.11.3 Monitoring of Reclamation and Wildlife Use

The purpose of the Closure monitoring is to determine if the reclamation measures have met the closure objectives (to reclaim the land as near as practicable to its original state). Areas of the Project that have been actively reclaimed will require monitoring to ensure the continued success of the closure program. The reclamation and monitoring programs will involve Kaska, to the extent possible.

Monitoring of reclaimed areas will take place annually during Active Closure, Transition Closure, and Post-closure to evaluate the revegetation establishment and the effectiveness in controlling erosion, as outlined in Table 7-30. Aerial reconnaissance is an effective method for the initial years and will be completed to identify any locations where severe erosion or drainage alteration has occurred as well as any additional locations warranting ground reconnaissance, further monitoring and additional reclamation prescriptions. Potential issues that may be identified through aerial reconnaissance include terrain instability (e.g., slope movement and trench subsidence), soil erosion or drainage alteration, poor vegetation cover establishment, groundwater seepage, watercourse crossings, and condition of access control management structures. As the site is reclaimed, the

program may be modified to only include ground reconnaissance of key areas that still require monitoring and maintenance to meet closure criteria.

Through monitoring and evaluation, additional reclamation measures will be employed in areas that have not revegetated successfully. Maintenance activities to support revegetation include scarifying, fertilizing, planting, reseeding, and erosion control measures. Post-closure, monitoring frequency will be reduced to areas that still need to meet closure criteria. Maintenance requirements are expected to be minimal in the Post-closure phase.

Revegetated areas will be inspected annually following initial planting until vegetation is successfully established and self-sustaining in accordance with performance criteria. The monitoring program will include measurements along established transect lines and plots to provide a detailed record of vegetation growth (including succession of species) and groundcover over time. The following components will be monitored to assess reclamation success:

- Soil for analysis of nutrients, pH, metal content and soil establishment until the vegetation is successfully established and self-sustaining in accordance with agreed criteria;
- Metals uptake in vegetation (including in the CWTS) measured periodically to determine if that uptake poses unacceptable risk to human, wildlife, and environmental health;
- Monitor sediments in CWTS for metals (including metals stability);
- Monitor revegetation progress such that it meets technical needs (e.g., maintaining physical stability), aesthetic needs (e.g., blends with surroundings), and future use targets, and does not impact the effectiveness of selected closure activities or become a source of metals due to uptake;
- Monitor reclaimed wetlands for biodiversity;
- Monitoring for propagation of non-native or undesirable species;
- Monitoring expansion of growth areas outside planted zones and determine if the effects are beneficial or detrimental to performance of closure measure; and
- Monitor wildlife use of revegetated areas to determine if viable wildlife habitat has been re-established.

Table 7-30: Summary of Closure Period Monitoring for Reclamation and Wildlife

Monitoring Program	Monitoring Locations	Timing	Summary	Active Closure	Transition Closure	Post - Closure
Terrestrial Resources: Revegetation Success	Specific locations where reclamation/revegetation occurred and other discrete locations	Mid-summer	Seedling survival, height growth, germination success, composition, natural succession	Annually	Annually (for 3 years) then TBD	TBD
Terrestrial Resources: Metals Concentrations	Specific locations where growth media were applied and other discrete locations	Mid to late summer	Monitoring of metals in soil and biota	Every 3 years	TBD	TBD
Terrestrial Resources: Wildlife	Established transects on reclaimed facilities; annual rut and late winter ungulate surveys	October rut, March late winter, summer during revegetation survey	Quantify species use from sightings and signs	Annually	TBD	TBD

7.11.4 Aquatic Resources

The objective of closure monitoring of aquatic resources is to ensure that downstream aquatic resources are being protected in the long-term. It is assumed that the success of the fish habitat offset program under a Canadian *Fisheries Act* authorization will be proven and no further fish population monitoring will be required.

Aquatic resource monitoring will include the Yukon permit requirements by water licence conditions and Environmental Effects Monitoring as required by the Federal *Metal and Diamond Mining Effluent Regulations*. During Closure, it is planned that the water licence conditions be aligned with the Environmental Effects Monitoring program. Details of the water licence and Environmental Effects Monitoring program for Operations are set out in the EMSRP (BMC, 2024m) and AMP (BMC, 2024n), and the planned schedule for the Closure phases is outlined in Table 7-31.

Table 7-31: Summary of Closure Period Monitoring for Aquatic Resources

Monitoring Program	Monitoring Locations	Timing	Summary	Active Closure	Transition Closure	Post - Closure
Aquatic Resources: Benthos/Sediment/ Toxicity	KZ-9, KZ-13, KZ-15, KZ-16, KZ-17, KZ-21, KZ-26, KZ-37	Low flow (fall)	Field sampling and lab analyses	Every 3 years	Every 3 years	TBD

7.11.5 Traditional Land Use

The quality of country foods (specifically vegetation and wildlife) is related (in part) to the quality of soil in the environment in which they live. Spills during Construction, Operations and Closure Phases have the potential to affect soil quality however, because all spills and affected soils will be cleaned up at the time of release, and following completion of an Environmental Site Assessment to assess

site conditions (following the *Yukon Contaminated Site Regulations* (YG, 2002)), there is no potential for these foods to become impacted from exposure to a spill during Construction, Operations and Active, Transition and Post-closure. Confirmatory soil and vegetation monitoring will be undertaken (as mentioned above) in collaboration with Kaska and the results will be made available to the communities. The vegetation monitoring will include berries. Additional details regarding the soil and vegetation monitoring methods are provided in the EMSRP (BMC, 2024m).

This monitoring program will ensure that concentrations in the soils and vegetation at Closure are at levels which the traditional land users can safely use the land in the Geona Creek valley for traditional land use purposes. With this monitoring and the commitment to ongoing engagement the risk of the traditional land users of avoiding the Project area in Post-closure will be reduced.

7.12 PERFORMANCE UNCERTAINTY AND RISK MANAGEMENT

The planning for reclamation and closure of any Mine development project relies upon a number of assumptions and predictive undertakings (e.g., water quality modelling, waste cover performance, water treatment performance) related to anticipated future conditions and Closure measure performance. By its very nature, planning for future events and performance involves varying degrees of uncertainty. Some elements of Mine closure planning have a higher degree of certainty (e.g., performance of erosion control measures) than others (e.g., long-term site runoff water quality).

Successful Mine closure planning therefore requires planning and management tools which acknowledge this uncertainty and take appropriate measures to reduce the risk associated with uncertain outcomes in the Closure periods. This section summarizes some key efforts both already undertaken and planned to reduce this risk, as planning for Reclamation and Closure of the Project moves along the Closure planning continuum.

7.12.1 Risk Management

As monitoring of baseline and environmental conditions continues leading up to the Construction Phase, and as data collection from the monitoring programs continues through Mine Operations, closure planners will have the ability to use these data to calibrate predictive models used as the basis of Closure planning and design. As Closure approaches, measures can be adjusted if required if the predictive work changes through the calibration process. This will reduce risks to the Project in Closure associated with uncertainty regarding future conditions.

BMC has undertaken several formal risk assessments to evaluate potential areas of risk and determine subsequent mitigations (BMC, 2017b). Specifically, a multi-stakeholder FMEA was conducted in September 2018 to identify potential failure modes and the resulting consequences during the Closure phases of the Project. The FMEA was conducted as a formal risk assessment process that sought to inform the selection of Closure options of the various components of the Project and identify mitigations to minimize the potential effects of the Project Post-closure. A summary of the FMEA is provided in Appendix A, and the outcome of that FMEA is an updated list of mitigations that, when applied, reduce the overall risk of the Project Post-closure.

The FMEA process used in the Closure FMEA was consistent with previous FMEA's held by BMC for Operations, as follows:

1. **Scenario identification:** the major Project components are analyzed to identify potential failure modes, hazard scenarios and their potential causes to identify resulting accidents and malfunctions to be addressed in the assessment;
2. **Effects analysis:** the likelihood of occurrence (i.e., probability) based on the Project design and consequence (i.e., severity) based on the potential environmental effects are identified for each of the accidents and malfunctions scenarios;
3. **Risk level determination:** the risk level is determined in the combination of the likelihood and consequence; and
4. **Mitigation:** for the effects with high or unacceptable risk levels, mitigation measures are identified to bring the risk level to an acceptable level.

The FMEA specifically considered the following Project components:

- ABM open pit;
- Underground;
- Class A, B, and C Waste Storage Facilities;
- LGO Stockpile and ROM Pad;
- Mine Infrastructure;
- Hazardous Materials;
- Access Road;
- Water Management Structures and Systems;
- Planned Early Closure; and
- Planned Temporary Closure.

The results and mitigations of the FMEA (Appendix A) have been incorporated into the design and implementation of reclamation and closure measures described herein. Risks for which there is a higher degree of performance uncertainty can be addressed in an adaptive management framework as discussed in the following section.

7.12.2 Adaptive Management Plan

Adaptive management is an approach to environmental management that is appropriate when a mitigation measure may not function as intended or when broad-scale environmental change is possible. Adaptive management plans are precautionary in nature and provide a level of security in long-term planning. Adaptive management plans also allow for the inclusion of improved science to be incorporated into mitigation measures as they are continually revised.

The Adaptive Management Plan for Closure will build upon the results and outcomes of the monitoring and adaptive management undertaken during Mine operations, as detailed in the AMP (BMC, 2024n). The AMP identifies the following components as requiring monitoring during the Operations phase of the Project:

- Air quality;
- Surface water quantity and quality;
- Groundwater quantity and quality;
- Wildlife;
- Geochemistry;
- Aquatic ecosystems and resources;
- Vegetation and soil; and
- Physical stability.

The adaptive management approach is as follows:

1. Determine management objectives;
2. Develop management strategies, the monitoring program, and thresholds;
3. Monitor the effectiveness of management strategies;
4. Evaluate and report the results of management strategies; and
5. Develop and implement alternative mitigation measures, if required.

The AMP focuses on Construction and Operations and will form the basis of Closure monitoring. Details of the adaptive monitoring for Closure will be developed once Operations have been underway for some time and have been validated to determine components requiring adaptive management during Closure.

8 RECLAMATION AND CLOSURE SCHEDULE AND EXECUTION STRATEGY

Three distinct Closure phases have been identified for the Project: Active Closure, Transition Closure and Post-closure. These have been identified for planning purposes because:

- In some cases, there are different objectives for different periods of time following the cessation of mining activities;
- There are distinct physical activities required in each stage to meet the Closure objectives; and
- The filling of the ABM open pit to create the ABM lake delays the final water drainage and discharge condition, and creates a transition period prior to the pit water commencing outflow to Geona Creek.

These separate periods are outlined below with the details regarding the associated schedule and execution strategy. Table 8-1 summarizes the Mine development and Closure phase schedule and execution strategy.

Table 8-1: Closure Schedule and Execution Strategy Summary

Development Period	Years	Site Conditions	Closure Activities
Mine Construction (Figure 5-1)	4	Construction of Mine facilities and stripping of open pit and waste facility footprints (progressively)	Removal and stockpiling of topsoil/overburden from ABM open pit and facility footprints. Diversion of Fault Creek into South Lakes. Sedimentation control.
Mining Operations (Figure 5-2)	10	Active mining operations underway	Continued removal and stockpiling of topsoil/overburden from facility footprints. Progressive reclamation of Waste Storage Facilities. Active water treatment.
Active Closure (Figure 5-3)	3	Active mining operations completed	Removal of ABM open pit equipment and infrastructure. Removal of underground infrastructure and equipment and sealing of portals. UWMP, LWMP Pit Rim Pond and Overburden Stockpile Collection Pond decommissioned. Construct CWTS. Remove Fault Creek diversion and re-direct Fault Creek into ABM open pit. ABM lake lime/carbon water treatment begins. Complete closure covers and revegetation of Class A, B and C Storage Facilities. Active water treatment of Class A and Class B Collection Pond water, as required. Routine monitoring and maintenance.
Transition Closure (Figure 5-4)	3	Pit filling	ABM lake water treatment continues as required using lime and carbon sources. ABM open pit spillway constructed. Some roads decommissioned. Class A, Class B, and Class C Collection Ponds decommissioned once water quality objectives are proven to be achieved and active water treatment is no longer required. Routine monitoring and maintenance.
	12	Pit finishes filling	Routine monitoring and maintenance. ABM lake water treatment continues as required using lime and carbon sources.

Development Period	Years	Site Conditions	Closure Activities
Post-closure (Figure 5-5)	10	ABM lake flows from engineered spillway to Geona Creek	Routine monitoring and maintenance. Site is considered to be in passive state.

8.1 ACTIVE CLOSURE PERIOD

The Active Closure period is the approximately three-year period immediately following cessation of Operations, where the most consequential decommissioning and reclamation work is completed. The general arrangement for Active Closure is shown on Figure 5-3.

Mining equipment will be removed, most infrastructure will be decommissioned, and the Fault Creek diversion will be removed to allow Fault Creek to return to its pre-mining channel and to begin filling the ABM open pit. ABM open pit in situ water treatment will begin and continue through Transition Closure.

Most major earthworks will be completed during this period. The areas of the Class A and B and C Storage Facilities not reclaimed progressively during Operations will be reclaimed. The UWMP, LWMP, the Pit Rim Pond and the Overburden Stockpile Collection Pond will be decommissioned.

The camp will be partially decommissioned. All operational water treatment and management systems (i.e., seepage collection and conveyance) will be retained and functional, and monitoring and inspection regimens will remain in place, unchanged from Operations.

Site roads that will not be required during Transitional Closure for monitoring and maintenance activities will be reclaimed.

8.2 TRANSITION CLOSURE PERIOD

The Transition Closure period is estimated to last approximately 12 years, during which time the ABM open pit continues to fill, ending when the ABM lake begins to outflow to Geona Creek. The Project layout for the Transition Closure period is shown on Figure 5-4.

The Collection Ponds for the Class A Storage Facility, Class B Storage Facility and Class C Storage Facility will remain on site and functional until such time as the water quality objectives and effluent discharge standards are met. The water treatment plant will be retained in a ready state as a contingency.

Monitoring and maintenance of the reclamation earthworks will be undertaken during this period as the waste cover systems and revegetation establish.

8.3 POST-CLOSURE PERIOD

The Post-closure period commences with the spilling of the ABM lake water into Geona Creek via the engineered spillway and CWTS. The Project layout for the Post-closure period is shown on Figure 5-5 (given that the CWTS is a contingency it is not presented in the figure).

The period is planned to be approximately 10 years of monitoring and maintenance. Once the objectives and performance criteria are achieved, the WTP and remaining infrastructure will be demobilized/decommissioned, and site water management will be passive in nature.

9 RECLAMATION AND CLOSURE LIABILITY

Reclamation and closure costing for the RCP has been updated to incorporate design refinements completed as part of the Feasibility Design of Tailings Waste and Water Management Facilities Report (KP, 2019a). Closure costing is the basis for the provision of security held by YG. The closure cost estimate is based on the YG guidance document Reclamation and Closure Planning for Quartz Mining Projects (YG, 2013).

Cost estimates were based on the following:

- Labour cost hourly rates were based on the most recent YG Fair Wage Schedule Category Rate. Rates are 'loaded' to 150% of the base rate to account for rostering, remote work and overtime;
- Equipment productivity rates for the various types of work were calculated based on the Caterpillar Performance Handbook version 48 (Cat, 2018);
- Equipment hourly rates are based on the 2025 / 2026 BC Road Builders Blue Book (BC Road Builders and Heavy Construction Association, 2025) (as Yukon Government third party equipment rental costs are no longer publicly available); and
- Earthwork volumes, disturbance areas and linear distances were based on the Feasibility Design of Tailings Waste and Water Management Facilities Report (KP, 2019a) and related design AutoCAD files.

Where possible, cost estimates were made using unit cost per volume calculated from equipment hire costs, equipment productivity rates and volumes/areas/lengths of earthwork.

Where the use of unit costs per volume/area/length were not applicable, an estimation of equipment and labour hours were used, derived from Ensero's operational and professional experience with other closure program costing estimates prepared for YG (i.e. Minto Mine, Keno Hill) and BMC's continual development and refinement of the Reclamation and Closure Plan.

Water treatment costing was estimated based on costs provided by Integrated Sustainability Consultants. Active treatment costs were included for the Active and Transition Closure phases. Passive treatment is included in the form of a capital cost for the construction of the CWTS and maintenance of the CWTS into Post-closure.

The annual costs for Closure care, maintenance, and monitoring were estimated, and applied for 25 years of Closure (three years Active Closure, 12 years Transition Closure and 10 years Post Closure). These costs were based on the monitoring and maintenance programs as described in Section 7.11 as well as the cost of an Active Closure, and Post-closure site environmental assessment. Additionally, instrumentation, vegetation maintenance, erosion maintenance, and transportation costs were included.

An overall rate of 15% was added to the estimated cost of implementation and Post-closure care, maintenance, and monitoring (PCCMM) to cover indirect costs such as insurance, taxes, and other administrative costs. Additionally, a cost contingency allowance of 20% was added to the total cost of closure implementation and PCCMM to account for uncertainties in the level of design at this time.

Provision for the effect of inflation on the estimated direct and indirect costs has been included for all scenarios, so these should be viewed as future values, rather than present values. The average inflation rate in Canada over the previous five years (2021 to 2026), as published by the Bank of Canada has been adopted (3.70% per year), with the number of years to commencement of closure accounted for in each scenario.

As the Project advances, the RCP and closure cost estimate will be reviewed every two years and Closure costs updated based on more detailed engineering plans and relevant operating experience. This estimate will be further refined in accordance with the continual review and revision of the RCP required by YG.

Closure cost calculations are detailed in the cost estimating tables as provided in Appendix E, updated and resubmitted as required.

9.1 CLASS C STORAGE FACILITY CLAIM FRACTION

A claim fraction exists within the footprint of the Class C Storage Facility. BMC intends to deal with the claims fraction through a new lands lease under the *Territorial Lands (Yukon) Act*.

The total footprint of the Class C Storage Facility is 1,267,000 m² and the footprint of the claims fraction (inside the Class C footprint) is 196,100 m², or approximately 15.5% of the total area.

For simplicity, BMC intends to hold the full financial security with the QML, with no financial security attached to the lands lease. As such, all financial security numbers in this plan include the area of the claims fraction.

The specific reclamation cost for the Class C Storage Facility is detailed in Appendix E.

9.2 RECLAMATION AND CLOSURE LIABILITY SUMMARY

The following sections outline the methodology and assumptions used for estimating reclamation and closure costs for the Project. A detailed breakdown of this estimate is provided in Appendix E.

9.2.1 General and Administration

Unit rates for general and administration items are largely based on experience from other similar Yukon projects, and include the following:

- On site management costs for 15 years (three for Active Closure and 12 for Transition Closure), including:
 - Pickup trucks;

- Equipment maintenance;
- Power and heat;
- Camp; and
- General administration.
- Transportation:
 - Employee transport; and
 - Road maintenance.
- Health and safety:
 - Development of a site-specific Occupational Health and Safety plan;
 - Worker orientation; and
 - First-aid supplies.

9.2.2 Exploration Disturbances

Exploration disturbance costs, such as drillhole abandonment, are based on previous Project experience.

9.2.3 Reclamation and Closure Planning

Reclamation and closure planning costs are based on experience from Yukon Projects, and include:

- Reclamation research;
- Development of Adaptive Management Plans; and
- Materials testing.

9.2.4 Open Pit and Underground Mine

Open pit and underground mining costs include nominal costs for equipment removal, access control and geotechnical control, based on experience from Yukon projects and includes:

- Equipment removal and cleaning and removal off site;
- Access controls:
 - Completing perimeter safety berms;
 - Blocking road access; and
 - Signage.
- Geotechnical controls:
 - Pit wall stabilization.

- ABM open pit in-situ water treatment; and
- Sealing of underground mine openings.

9.2.5 Waste Rock and Tailings

Reclamation and closure costs for the waste rock and tailings management facilities include:

- Crest regrading of the Class A, Class B, Class C Waste Storage Facilities and Overburden Stockpile as well as regrading of the topsoil stockpile areas; and
- Cover construction, including:
 - Composite cover including an 80 mil textured HDPE geomembrane for the Class A and Class B Storage Facilities; and
 - Growth media placement.

9.2.6 Surface Facilities

Reclamation and closure costs for surface facilities includes:

- Remediation of the LGO Stockpile and ROM pad;
- Demolition of the Process Plant and associated buildings, including:
 - Removal of salvageable equipment;
 - Dismantling of buildings;
 - Washing and decontamination of equipment;
 - Concrete demolition; and
 - Hauling of scrap materials.
- Remediation of the Fuel Storage Area, including:
 - Cleaning and decontamination of tanks;
 - Removal of tanks and piping; and
 - Removal of HDPE geomembrane.
- Removal of Process Plant reagents (off site); and
- Process Plant area land reclamation, including:
 - Soils testing;
 - Hauling of contaminated soils to the WMF;
 - Growth media placement; and
 - Site revegetation.

9.2.7 Water Storage Ponds

Reclamation and closure costs for all site water management facilities includes:

- Dam removal, including:
 - Engineering design for removal;
 - Pumping down water;
 - Breaching dam and relocating dam material;
 - Slope stabilization with erosion barriers;
 - Growth media placement; and
 - Site revegetation.

9.2.8 Infrastructure

Reclamation and closure costs for site infrastructure include:

- Camp and related infrastructure decommissioning, including:
 - Disconnection of services;
 - Removal of salvageable equipment;
 - Dismantling of buildings;
 - Hauling of scrap materials;
 - Removal of sewage system; and
 - Revegetation.
- Bulk explosives facility decommissioning, including:
 - Removal of salvageable equipment;
 - Removal of bulk materials;
 - Dismantling of buildings;
 - Disconnection of services;
 - Hauling of scrap materials; and
 - Growth media placement and revegetation.

9.2.9 Waste Disposal

Reclamation and closure costs for waste disposal includes:

- The Waste Management Facility, including:
 - Prepare and submit detailed closure plan;

- Removal of waste materials in accordance with the Waste Management Plan (BMC, 2024j);
- Removal of recyclables and special waste materials;
- Soil characterization of Waste Management Facility;
- Removal of contaminated soil from the Land Treatment Facility;
- Recontour; and
- Growth media placement and revegetation.

9.2.10 Roads and Trails

Reclamation and closure costs for roads and trails include:

- Recontouring;
- Scarification;
- Erosion barriers; and
- Site revegetation.

9.2.11 Water Management

Reclamation and closure costs for water management includes:

- Reclamation of the Fault Creek Diversion and other site diversions;
- Decommissioning of the Finlayson Creek pipeline;
- Monitoring well decommissioning; and
- 15 years of Active treatment costs (three for Active Closure and 12 for Transition Closure).

9.2.12 Sediment and Erosion Control

Operational diversion ditches will be removed at Closure. Costs associated with sediment and erosion control in Closure are covered in PCCMM cover repairs.

9.2.13 Mobilization and Demobilization Costs

Costs for mobilization of the construction fleet are based on unit rates sourced from the BC Road Builders Blue Book, assuming equipment is sourced from Whitehorse.

9.2.14 Interim Care, Maintenance, and Monitoring

Interim care and maintenance is required for security estimation purposes as it is associated with YG potentially having to take over the site. Interim care, maintenance and monitoring costs include:

- On site management costs for two years, including:
 - Pickup trucks;
 - Equipment maintenance;
 - Power and heat;
 - On site Caretaker;
 - Other part-time personnel (Electrician, Mechanic, Supervisor);
 - Camp costs;
 - Communications allowance; and
 - Miscellaneous supplies allowance.
- Transport costs, including:
 - Employee transport; and
 - Heavy equipment mobilization and demobilization.
- Site maintenance and equipment costs, including:
 - Road maintenance; and
 - Earthworks maintenance.
- Water treatment costs (two years); and
- Monitoring costs.

9.2.15 Post-Closure Care, Maintenance, and Monitoring

Rates for Post-closure care, maintenance and monitoring are based on information available from Minto Mine, Keno and other projects, with quantities appropriate for the Project. Environmental monitoring rates are based on monitoring locations outlined in the EMSRP (BMC, 2024m). Costs included in the closure estimate are calculated as a Net Present Value (NPV) based on the year they will be incurred, using a discount rate of 7%. NPV was calculated using the formula $NPV = C/(1 + i)^t$, where:

C is the full cost;

i is the discount rate; and

t is the number of years from present.

Post-closure care, maintenance and monitoring costs include the following:

- Environmental Assessment;
- Instrumentation (water quality, flowrate, meteorological);

- Water treatment, including:
 - Passive treatment operation and maintenance costs.
- Reclamation maintenance, including:
 - Cover repair; and
 - Revegetation repair.
- Site maintenance, including:
 - Road maintenance; and
 - Earthworks maintenance.
- Transport costs, including:
 - Employee transport; and
 - Heavy equipment mob-demob.
- Water quality monitoring (surface and groundwater);
- Monitoring, including:
 - Air quality, rock and soil geochemistry, biological, environmental reclamation measures.
- Instrumentation maintenance/replacement;
- Geotechnical monitoring:
 - Inspection, reporting, periodic instrumentation upgrades and/or replacement.

9.3 CURRENT, YEAR 2 AND YEAR 5 COST SUMMARY

The current, financial year 2 and financial year 5 reclamation and closure costs, including contingency are detailed in Appendix E, as described in Section 9.2.

The current liability is described in Section 9.3.1, details regarding the “Year 2” and “Year 5” liability are provided in Section 9.3.2 and Section 9.3.3, respectively. For the purpose of this estimate, “Year 2” refers to the two-year period commencing with formal receipt of the QML, and Year 2 Project Site Layout is shown in Figure 9-1. “Year 5” refers to the five-year period commencing with formal receipt of the QML, and Year 5 Project Site Layout is shown in Figure 9-2.

9.3.1 Current Reclamation and Closure Cost Estimate

The site currently has a relatively low level of disturbance related to exploration related activities. Costs that will be incurred in this scenario include capping of monitoring wells and decommissioning and removal of site infrastructure (camp and offices).

9.3.2 Year 2 Reclamation and Closure Liability Estimate

The activities planned to be completed in the first two years following the receipt of the QML relate to one year of detailed design engineering and approximately one year of preliminary construction. Preliminary construction will consist of the following activities:

- Foundation preparation for the Process Plant (not including any concrete works);
- Storage of stripped topsoil in designated stockpiles for future reclaim and reuse;
- Storage of any unsuitable overburden in the overburden stockpile and construction of the overburden collection pond; Borrow pit stripping with temporary crushing/screening plant and material stockpiles;
- Temporary offices;
- Temporary fuel area;
- Waste Management Facility;
- Temporary service roads;
- Diversion Channels, including the construction of Fault Creek Diversion; and
- Temporary magazine.

Site infrastructure established by the end of Year 2 are illustrated in Figure 9-1 and include the Process Plant subgrade foundation excavations, overburden stockpile and overburden collection pond, temporary offices/fuel area, borrow pit area, temporary explosives facility and magazines, Waste Management Facility clearing and surface preparation, camp area, core storage area, roads and trails and diversion channels. Disturbed areas will be regraded and revegetated. The borrow pit will be utilized for Class C and overburden construction materials as needed. There will be no waste rock generated from preliminary construction activities. Appendix E summarizes the quantities of the Year 2 disturbance activities.

YEAR 2 PROJECT SITE LAYOUT

SEPTEMBER 2024

D:\Project\AI\Projects\Kudz_Ze_Kayah\Maps\01_Overview\03-Specific Topics\Project_Development\Year2_Site_Layout_20240904.mxd
(Last edited by: amallashevskia, 2024-09-04/06:30 AM)

9.3.2.1 Initial Site Development

Initial site development will focus on mobilization of an earthmoving fleet to site for bulk earthworks to construct the process plant pad. This fleet will also be used to complete the Upgraded Tote Road between the camp and Mine area, including construction of the diversion drain and initial pioneering of the Process Plant Access Road. Temporary facilities to enable this work will also be established, including fuel storage, temporary offices and temporary magazine.

Other works completed during this phase will include construction of the camp up to 350 room capacity in advance of full construction works and the Waste Management Facility for management of waste during construction works.

9.3.2.2 Site Water Diversion Works

This work covers the construction of the water diversion channels on the western and eastern slopes of the valley. Spoil from construction of the water diversion channels will be placed alongside the channels for future reclamation use.

A borrow pit will be opened within the Class A WSF (or other suitable area) for the production of rip rap as required for water diversion construction.

9.3.2.3 Process Plant and Infrastructure Construction

Construction of the Process Plant foundations (not including concrete) and other infrastructure within this general area. A laydown area for receipt and storage of goods prior to construction will be established within the Class A and/or Class B WSF footprints.

Temporary offices for management of the construction works will also be established within the footprints of the Class A and/or Class B WSF.

9.3.2.4 Water Management Infrastructure

The timing of construction of many aspects of the water management and waste rock infrastructure is seasonally dependent. Construction timing will overlap with other construction activities to varying degrees.

Water management facilities that may be developed are:

- Fault Creek Diversion;
- Diversion Ditches; and
- Temporary sedimentation ponds as required for construction.

9.3.3 Year 5 Reclamation and Closure Liability Estimate

It is expected that at the conclusion of a five year period from receipt of the QML that all site construction activities will have been completed and that the first year of production will have been completed, as illustrated in Figure 9-2. Site infrastructure will include:

- Accommodation facility;
- Core storage facility;
- Open pit mine, including overburden dewatering trenches;
- Processing plant facility, including the ROM Pad and LGO stockpile;
- Water treatment plant;
- Power generation facility, with associated diesel and LNG storage infrastructure;
- Class A, B and C waste storage facilities, and associated collection ponds;
- Overburden stockpile and associated collection pond;
- Topsoil stockpiles;
- Upper and Lower water management ponds;
- Pit rim pond;
- Site water diversion network;
- Mining workshop facility;
- Explosives storage facility;
- Site administration facilities;
- Waste management facility; and
- Site road network.

With only one year of mining completed, the quantity of waste rock and tailings placed in the waste storage facilities is less than that planned for the final site disturbance. Accordingly, it is expected that the period of time to complete closure activities is also reduced, with Active Closure estimated to be completed in two years and Transitional Closure in eight years. 10 years of Post Closure monitoring and maintenance is included, consistent with that of closure for the full Project development. Appendix E summarizes the quantities of the Year 5 disturbance activities.

Re: Kudz Ze Kayah Project Reclamation and Closure Plan Failure Modes and Effects Analysis

1 INTRODUCTION

This memo summarizes the results of a multi-stakeholder Failure Modes Effects Assessment (FMEA) conducted September 6, 7, and 10, 2018 which identified potential failure modes and the resulting consequences during the proposed reclamation and closure phases of BMC Minerals (No.1) Ltd. (BMC) Kudz Ze Kayah (KZK) Project. The FMEA was conducted as a formal risk assessment process that sought to inform the selection of closure options of the various components of the KZK Project and identify mitigations to minimize the potential effects of the Project post-closure. The outcome of the FMEA is an updated list of mitigations, that, when applied, reduce the overall risk of the KZK Project post-closure.

The FMEA process used in the reclamation and closure FMEA was consistent with previous FMEA's held by BMC (e.g., KP, 2017) and follows the process outlined in Section 17 of the KZK Project Proposal (BMC, 2017a), as follows:

1. **Scenario identification:** the major Project components are analyzed to identify potential failure modes, hazard scenarios and their potential causes to identify resulting accidents and malfunctions to be addressed in the assessment;
2. **Effects analysis:** the likelihood of occurrence (i.e., probability) based on the project design and consequence (i.e., severity) based on the potential environmental effects are identified for each of the accidents and malfunctions scenarios;
3. **Risk level determination:** the risk level is determined in the combination of the likelihood and consequence; and
4. **Mitigation:** for the effects with high or unacceptable risk levels, mitigation measures are identified to bring the risk level to an acceptable level.

The FMEA specifically considered the closure aspects of the following components:

- ABM open pit;
- Underground Mine;
- Class A, B & C Waste Storage Facilities
- Ore Stockpiles and Pads;
- Mine Infrastructure;
- Hazardous Materials;
- Access Road;
- Water Management Structures and Systems;
- Planned Early Closure; and
- Planned Temporary Closure.

2 SUMMARY OF RELEVANT CLOSURE CONDITIONS

The FMEA considered the KZK Project closure conditions as defined in the Reclamation and Closure Plan. Broadly, this included three periods at the end of the operational mining period (Year 9): Active Closure Period (years 9 to 11), Transitional Closure Period (years 12 to 23), and the Post-Closure Period (years 24 to 40).

Active closure immediately follows the completion of mining operations, where the following activities are to be conducted:

- Removal of pit equipment and infrastructure;
- Removal of underground infrastructure and equipment, and sealing of portals;
- Remove Fault Creek diversion, re-direct Fault Creek into ABM open pit, pit lime/carbon water treatment begins, active water treatment (as required);
- Place waste covers on the Class A, B and C Waste Storage Facilities; and
- Decommission infrastructure and remove from site.

Transition closure is a 12-year period during which the ABM open pit continues to fill, ending when the ABM lake begins to overflow to Geona Creek, and includes the following activities:

- ABM Lake water treatment continues as required using lime and carbon sources; active water treatment if/as required;
- ABM open pit spillway constructed;
- Some roads decommissioned; and
- Routine monitoring and maintenance.

The post-closure phase is a 17 year period of routine monitoring and maintenance to confirm the water management and treatment system are functioning as designed. ABM lake water treatment using lime and carbon sources may be continued, and active water treatment will continue if/as

required. The upper water management pond will be decommissioning following confirmation that storage facility covers are meeting performance criteria.

3 FMEA WORKSHOP

3.1 PARTICIPANTS

The FMEA was held via in-person, whole day workshops on September 6 and 7, 2018 in Vancouver, BC. The FMEA was continued in the morning of September 10, 2018 via online conferencing (WebEx). In-person participants of the workshop on September 6 and 7 included:

- Kelli Bergh, Environmental Manager, BMC Minerals (No.1) Ltd.;
- Jim Newton, Chief Mine Engineer, BMC Minerals (No. 1) Ltd.;
- Jim Harrington, President, Alexco Environmental Group Inc.;
- Robert Johnson, Delta Engineering Ltd. (consultant with Dena Cho Environmental and Remediation Inc.);
- Tesloa Smith, RRDC Elder with Dena Cho Environmental and Remediation Inc.;
- Dorothy Smith, RRDC Elder with Dena Cho Environmental and Remediation Inc.;
- Les Galbraith, Specialist Engineer, Knight Piésold Consulting;
- Madeline Pease, Project Engineer, Knight Piésold Consulting; and
- Mary Mioska, Senior Environmental Manager, Alexco Environmental Group Inc.

Participants in the September 10, 2018 WebEx workshop included:

- Kelli Bergh, Environmental Manager, BMC Minerals (No.1) Ltd.;
- Jim Newton, Chief Mine Engineer, BMC Minerals (No. 1) Ltd.;
- Robert Johnson, Delta Engineering Ltd. (consultant with Dena Cho Environmental and Remediation Inc.);
- Madeline Pease, Project Engineer, Knight Piésold Consulting; and
- Mary Mioska, Senior Environmental Manager, Alexco Environmental Group Inc.

3.2 WORKSHOP METHODOLOGY

The FMEA workshop followed methodology initially used for the Class A Storage Facility FMEA conducted in September 2017 (KP, 2017), which defines risk as the factor between likelihood and consequence as follows:

$$\text{Risk} = \text{Likelihood} \times \text{Consequence}$$

The likelihoods and consequence definitions are summarized in Table 3-1 and Table 3-2, respectively. Likelihoods and consequences were also modeled off the Class A Storage Facility FMEA, but with the

frequencies of the likelihood ratings changed to reflect the active, transitional and post-closure phases defined above. For example, as there will be a relatively high level of activity during the active and transitional closure phases, compared to the post-closure phase when there will be minimal site activity, the definition for a “possible” likelihood was changed to be reflective of the active and transitional closure phases, which is 15 years.

Consequence descriptions are defined for six categories: Environmental Impact (EI), Special Considerations (SC), Legal Obligations (LO), Consequence Costs (CC), Community / Media Reputation (C/MR) and Human Health & Safety (HHS) (Table 3-2). Each of these categories were ranked individually, and the highest ranking chosen to calculate the resulting risk. The descriptions of the consequences reflect specific matters related for the KZK Project. For example, the category “special considerations” has been applied in this case to relate directly to the potential impacts to traditional land use. For the consequence costs ranking, the costs have been adjusted to reflect the impact of costs on a company comparable to BMC. Whereas a larger multi-national company may not consider costs greater than \$10 million to be critical, but would rank critical costs at a much higher value. Conversely, a smaller company may rank cost greater than \$2.5 million to be critical.

Table 3-1: Likelihood Descriptions

Likelihood					
Rating	Very Rare	Unlikely	Possible	Likely	Almost Certain
	1	2	3	4	5
Frequency	1 in 1,000 year event	1 in 200 year event	1 in 15 year event	Less than 1 event per year	More than 1 event per year

Table 3-2: Consequence Descriptions

Categories	Low	Minor	Moderate	Major	Critical
	1	2	3	4	5
Environmental Impact (EI)	No impact	Minor localized or short-term impacts	Significant impact on valued ecosystem component	Significant impact on valued ecosystem component and medium-term impairment of ecosystem function	Serious long-term impairment of ecosystem function
Special Considerations (SC)	Some disturbance but no impact to traditional land use	Minor or perceived impact to traditional land use	Some mitigable impact to traditional land use	Significant temporary impact of traditional land use	Significant permanent impact on traditional land use

Categories	Low	Minor	Moderate	Major	Critical
	1	2	3	4	5
Legal Obligations (LO)	Informal advice from a regulatory agency	Technical / Administrative non-compliance with permit, approval or regulatory requirement Warning letter issued	Breach of regulations, permits or approvals (e.g. 1 day violation of discharge limits) Order or direction issued	Substantive breach of regulations, permits or approvals (e.g. multi-day violation of discharge limits) Prosecution	Major breach of regulation - willful violation Court order issued
Consequence Costs (CC)	< \$100,000	\$100,000 - \$500,000	\$500,000 - \$2.5 Million	\$2.5 - \$10 Million	> \$10 Million
Community / Media Reputation (C/MR)	Local concerns, but no local complaints or adverse press coverage	Public concern restricted to local complaints or local adverse press coverage	Heightened concern by local community, criticism by NGOs or adverse local/regional media attention	Significant adverse national public, NGO or media attention	Serious public outcry / demonstrations and adverse international NGO attention or media coverage
Human Health & Safety (HHS)	Low-level short-term subjective symptoms. No measurable physical effect. No medical treatment	Objective but reversible disability, impairment and/or medical treatment injuries requiring hospitalization	Moderate irreversible disability or impairment to one or more people	Single fatality and/or severe irreversible disability or impairment to one or more people	Multiple fatalities

The likelihood and consequence ratings results were multiplied to give a risk rating from 1 to 25, as shown in Table 3-3.

Table 3-3: Risk Ratings

Risk		
Very Low	0 to 3	Very Low
Low	4 to 6	Low
Medium	7 to 12	Medium
High	13 to 20	High
Very High	21 to 25	Very High

The FMEA framework also incorporated the nine Fundamental Reclamation and Closure Objectives as defined by the Yukon Water Board (YWB) and the Yukon Government Department of Energy, Mines and Resources (EMR) in their guidance document *Reclamation and Closure Planning for Quartz Mine Projects* (YWB and YG, 2013), detailed in Table 3-4. These objectives were helpful in framing the potential concerns for closure and helped guide the thinking of the participants.

Table 3-4: Fundamental Mine Reclamation and Closure Objectives (from YWB and YG, 2013, pg. 4-5)

Value	Reclamation and Closure Objectives
Physical Stability	- All mine-related structures and facilities are physically stable and performing in accordance with designs; and - All mine-related structures, facilities and processes can withstand severe climatic and seismic events.
Chemical Stability	Release of contaminants from mine related waste materials occurs at rates that do not cause unacceptable exposure in the receiving environment.
Health and Safety	- Reclamation eliminates or minimizes existing hazards to the health and safety of the public, workers and area wildlife by achieving conditions similar to local area features; and - Reclamation and closure implementation avoids or minimizes adverse health and safety effects on the public, workers and wildlife.
Ecological Conditions and Sustainability	- Reclamation and closure activities protect the aquatic, terrestrial and atmospheric environments from mine-related degradation and restore environments that have been degraded by mine-related activities; and - The mine site supports a self-sustaining biological community that achieves land use objectives.
Land Use	Lands affected by mine-related activities (e.g., building sites, chemical and fuel storage sites, roads, sediment ponds, tailings storage facilities, waste rock storage areas, underground workings, etc.) are restored to conditions that enable and optimize productive long-term use of land. Conditions are typical of surrounding areas or provide for other land uses that meet community expectations.
Aesthetics	Restoration outcomes are visually acceptable.
Socio-economic Expectations	- Reclamation and closure implementation avoids or minimizes adverse socio-economic effects on local and Yukon communities, while maximizing socio-economic benefits; and - Reclamation and closure activities achieve outcomes that meet community and regulatory expectations.
Long-term Certainty	Minimize the need for long-term operations, maintenance and monitoring after reclamation activities are complete.
Financial Considerations	Minimize outstanding liability and risks after reclamation activities are complete.

4 RESULTS

Risks were identified for the following components, in the order that they are listed in the Risk Register (Appendix A):

1. Site wide;
2. ABM open pit;
3. Underground mine;
4. Class A Storage Facility;
5. Class B Storage Facility;
6. Class C Storage Facility
7. Water management structures and systems;
8. Mine infrastructure (during the post-closure period only);

9. Access Road;
10. Planned early closure; and
11. Temporary closure.

The ore stockpiles and pads were also considered, but as these are formed from the base of the Class B Storage Facility and will be closed at the same time as the Class B Storage Facility, the risks associated with the closure phase of these components are considered in the risk assessment for the Class B Storage Facility.

Risks from hazardous materials were also considered; however, as BMC has committed to a site assessment for contaminated soils to be conducted during the transition closure phase, there are no post-closure risks associated with hazardous materials.

Risks were then identified using the nine closure objectives as a guide. The risks were numbered sequentially, with the component number listed above as the primary reference number. For example, the first risk identified under the Class A Storage Facility was numbered 4.1. Not all components had risks under each closure objective, for example, there were no risks identified under the “aesthetics” closure objective.

Similarly, for some risks, not all consequence categories were applied. For example, for those risks that were deemed risks to animals, there was no Human Health & Safety consequence rating. Those instances are identified by “n/a” in the Risk Register (Appendix A).

Some risks were not able to be assigned likelihoods or consequences, such as risks 11.7 and 11.8 which apply to the regulatory risk during temporary closure. These risks cannot be quantified, as they could range from minor to major Project costs, and the likelihoods cannot be estimated.

In total, 80 risks associated with closure of the KZK Project were identified; however, some were deemed already mitigated by the proposed design and closure activities. These were left in the Risk Register with the associated design and mitigation measures listed for information, but no risk ratings were assigned to those risks. Of the 44 risks that were assigned likelihood and consequence ratings, 16 were classified as Very Low risk, 26 were classified as Low risk, 4 were classified as Medium risk (Table 4-1).

The risks that were classified as Medium include:

- **Risk 2.5 ABM open pit, Human Health and Safety:** risks due to access to the high walls and the ABM lake post-closure (possible with a major consequence).
- **Risk 4.12 Class A Storage Facility, Long-term Certainty:** risks due to regulatory uncertainty around long term management of tailings storage facilities. De-classifying tailings storage dams is currently being reviewed by the Canadian Dam Association. As a tailings facility, the Class A Storage Facility may require long-term perpetual monitoring (likely with a moderate consequence).
- **Risk 9.3 Access Road, Land Use:** Unauthorized access to the closed mine via the reclaimed access road (likely with a moderate consequence).
- **Risk 11.5 Temporary Closure, Socio-economic Expectations:** Temporary closure would results in an interruption in jobs and contracts. It is expected that only approximately 20 jobs will be

available during temporary closure, compared to approximately 346 during mine operations (almost certain with minor consequence).

Table 4-1: Risk Ratings – Initial FMEA Results

		Risk				
Likelihood	5	2.7, 3.2, 11.4	11.5			
	4	5.7, 7.4		4.12, 9.3		
	3	10.2	2.6		2.5	
	2		2.2, 4.9, 5.9, 6.5, 8.1, 8.2, 8.4, 11.1	3.4, 4.5, 4.7, 5.4, 6.3		
	1	3.1, 4.8, 5.6, 5.8, 6.4	4.1, 5.1, 6.1, 6.2	2.4, 4.2, 5.2	2.3, 3.5, 7.1, 11.9	4.3, 5.3
		1	2	3	4	5
Consequence						

For the risks that were rated as medium or high, additional mitigation measures were adopted, and have been included in the Reclamation and Closure Plan. These additional mitigations include:

- **Risk 2.5:** As the main concern is access to the ABM open pit during winter with snow machines, double berms have been proposed to prevent access to the pit. Previously, only single berms were proposed.
- **Risk 9.3:** Full time gatehouse management may be required to ensure no unauthorized access. Currently, seasonal gatehouse management is proposed during the active and transition-closure phases. A fence along the Robert Campbell Highway connected to the Access Road entry has also been suggested.

Risk 11.5 is considered an un-mitigatable risk that is inherent to temporary closure. However, open and transparent communication by BMC in the event of a planned temporary closure, as well as the fulfillment of BMCs commitments under the Socio-economic Participation Agreement (SEPA) between the Company and Kaska will help lessen the consequences of a temporary closure scenario on those employees that may be temporarily laid off from the KZK Project.

Risk 4.12 is considered financial risks to BMC, which is a corporate consideration, but not one that can be mitigated through design or management.

In light of the above, the risk ratings for risks 2.5 and 9.3 were updated to be Low, and the resulting updated Risk Rating summarized in Table 4-2.

Table 4-2: Risk Ratings – Updated FMEA Results

		Risk With Updated Mitigations				
Likelihood	5	2.7, 3.2	11.5			
	4	5.7, 7.4		4.12		
	3	10.2	2.6			
	2		2.2, 2.5,4.9,5.9,6.5,8. 1,8.2,8.4	3.4, 4.5, 4.7,5.4,6.3,9.3		
	1	3.1, 4.8,5.6,5.8,6.4	4.1, 5.1,6.1,6.2	2.4, 4.2,5.2	2.3, 3.5,7.1, 11.9	4.3, 5.3
		1	2	3	4	5
		Consequence				

5 UPDATED DESIGN AND MITIGATIONS

The design and mitigations for the KZK project as detailed in the Project Proposal and subsequent Information Responses (BMC, 2017a, c, d; BMC, 2018) were considered in the FMEA, and are listed for the corresponding risks in the Risk Register (Appendix A). However, during the course of the workshop, additional mitigation measures were discussed, and BMC has committed to investigating the application of these mitigations in the refined design of the KZK Project. These additional mitigation measures are listed in Appendix A, and are as follows:

- Consideration of additional pumping of water from water management ponds to fill the pit faster during the transition closure phase;
- Adaptively manage the *in situ* treatment of the ABM open pit through ongoing monitoring of results, with the commitment to conduct a second round of treatment, or additional lime/alkaline material addition if required;
- Lowering the invert of the ABM open pit spillway to achieve positive pressure continuously into the pit. This will eliminate the risk of groundwater flowing from the ABM open pit to South Lake post-closure;
- Evaluating the potential for pumping all collection water from the Class A and B storage facilities to the ABM open pit starting in Year 9.5;
- Designing the ABM lake spillway to account for the potential for glaciation; and
- During temporary closure, apply 1 m glacial till cover to the Class A Storage Facility to prevent water ingress and oxygen ingress immediately upon temporary closure

APPENDIX A. RISK REGISTER

Table A-1: Initial Risk Register

RISK NO.	Closure Objective	RISK DESCRIPTION	CONSEQUENCE DESCRIPTION	RISK RATING										CLASSIFICATION	DESIGN AND MITIGATION MEASURES
				Likelihood	Consequence						Max.	SCORE			
					Environmental Impact (EI)	Special Considerations (SC)	Legal Obligations (LO)	Consequence Costs (CC)	Community / Media Reputation (C/MR)	Human Health & Safety (HHS)					
ABM open pit														Mitigations/design: - shotcreting of the pit walls - lime dosing concurrently with organic amendment - Foundation concrete disposed in pit at end of mine life - Some waste rock will remain in pit at end of mine life	
2.1	Physical Stability	Localized wall failures	Localized sloughing of pit walls is consistent with design. Therefore, no risk associated with this failure in closure										No Risk	Design include: - Pit filling with groundwater, minimizes area of exposed rock (~150 m high wall)	
2.2	Physical Stability	Massive, sudden pit wall failure	Wall failure resulting in wave of ABM lake water, and remobilization of sediment	2	2	2	1	2	2	2	2	4	Low	- Spillway armoured to prevent impacts to wetland (if constructed) if there is a flood wave event	
2.3	Chemical Stability	Treatment not as efficient as predicted	Impacts to surface water via spillway	1	3	2	2	4	3	1	4	4	Low	- on-going humidity cells - refinement of proposed treatment during transition closure - Regular monitoring will be conducted prior to the ABM lake overflowing, therefore this would be identified quickly and re-treatment could be applied - Alkalinity benefits from Fault Creek inflow	
2.4	Chemical Stability	Treatment not as efficient as predicted	Impacts to groundwater leading to impacts to South Lakes	1	2	2	2	3	3	1	3	3	Very Low	- on-going humidity cells - refinement of proposed treatment during transition closure - Shotcreting of pit walls - Regular monitoring will be conducted when the ABM lake overflows, therefore this would be identified quickly and re-treatment could be applied - Alkalinity benefits from Fault Creek inflow	
2.5	Health and Safety	Human access	Access to high walls and lake	3	1	1	3	1	3	4	4	12	Medium		
2.6	Ecological Conditions and Sustainability	Animal access	Wildlife fatalities from falling over the edge	3	2	2	1	1	2	n/a	2	6	Low	Mitigations: - Wildlife barrier built with Class C rock - 2-3 m high berm at high wall locations - Benches in pit allow for escape routes	
2.7	Ecological Conditions and Sustainability	Animal use of the ABM lake and consumption of lake water	Water quality in ABM lake as it is filling is above use guidelines; once treated, the ABM lake meets CCME guidelines and is protective of wildlife use	5	1	1	1	1	1	n/a	1	5	Low		
2.8	Long-term certainty	Wet and dry years do not have a significant effect on the ABM open pit	No consequence										No Risk	See variable water balance model (KP, 2019)	
Underground Mine															
3.1	Physical Stability	Collapse of the underground workings (anything not paste backfilled) leading to localized subsidence of the pit wall		1	1	1	1	1	1	1	1	1	Very Low	Design includes: - paste backfill - portal is located below open ABM lake water level - portal bulkheaded	
3.2	Physical Stability	Localized rock failures		5	1	1	1	1	1	1	1	5	Low	Design includes: - paste backfill - portal is located below open ABM lake water level - portal bulkheaded	

RISK NO.	Closure Objective	RISK DESCRIPTION	CONSEQUENCE DESCRIPTION	RISK RATING									CLASSIFICATION	DESIGN AND MITIGATION MEASURES
				Likelihood	Consequence						Max.	SCORE		
					Environmental Impact (EI)	Special Considerations (SC)	Legal Obligations (LO)	Consequence Costs (CC)	Community / Media Reputation (C/MR)	Human Health & Safety (HHS)				
3.3	Chemical Stability	Model inaccurately predicts better water quality than is experienced in closure (see ABM lake Chemical Stability)											No Risk	Design includes: - paste tailings - flooded pit treatment Mitigation: - Ongoing monitoring of pit water
3.4	Health and Safety	Unauthorized access (transition closure)		2	1	1	1	1	2	3	3	6	Low	Design includes: - Bulkhead - Flooded ABM lake
3.5	Health and Safety	Unauthorized access (post-closure)		1	1	1	1	1	1	4	4	4	Low	Design includes: - Bulkhead - Flooded ABM lake
Class A Storage Facility														
4.1	Physical Stability	Deformation of facility components leading to slumping or localized damage to the cover system (transition closure)	Slow movement of buttress leading to cracks in cover and increased runoff contact with Class A material and increased seepage	1	1	1	1	2	1	1	2	2	Very Low	Design include: - Foundation preparation will include removal of any unsuitable material - Removal of overburden beneath buttress to bedrock - Construction considers level lifts - Water Treatment Plant still in place - Class A collection pond still in place Mitigation includes: - Operating the facility in accordance with the OM&S
4.2	Physical Stability	Deformation of facility components leading to slumping or localized damage to the cover system (post-closure)	Slow movement of buttress leading to cracks in cover and increased runoff contact with Class A material and increased seepage	1	2	2	1	3	3	1	3	3	Very Low	Post-closure: - Assumes annual inspections (due to status as a tailings facility) up to year 40, then every 5 years thereafter
4.3	Physical Stability	Global instability	Release of Class A material: slumping of Class A material that does not make it to the creek; contact runoff does make it to the creek	1	2	5	3	5	3	1	5	5	Low	Design includes: - Dry stack, therefore eliminates risk of slurried tailings reaching the creek
4.4	Physical Stability	Failure to follow OM&S (see ratings for deformation and global instability above)	e.g., material placement with too much ice/snow, too much precipitation, tailings not dewatered to specified moisture content										No Risk	
4.5	Chemical Stability	Cover failure (during transition and post-closure phases)	Cover failure leads to infiltration e.g., liner not sealed to engineer's specifications	2	2	2	2	3	2	1	3	6	Low	- monitoring of piezometers and groundwater wells regularly during operations will identify failure early in the mine life - the scenario foresees isolated localized failure, not wide spread failure of the liner, as wide spread failure would be detected during operations
4.6	Chemical Stability	Higher than predicted weather events	No consequence due to design measures										No Risk	Design includes: - Probable Maximum Flood, earthquakes
4.7	Chemical Stability	Source term predictions under-estimate metal loadings from tailings and waste rock	Water quality leaving facility significantly worse than predicted	2	2	2	2	3	2	1	3	6	Low	Design assumes no benefit from encapsulated material and subsequently no benefit from the associated limited oxygen diffusion Mitigation includes: - ongoing humidity test work and geochemical model refinement - pump back wells and WTP in place during transition closure
4.8	Health and Safety	Uptake of metals to vegetation growing on the cover	Consumption of metals in plants by humans or animals; however, the concentrations will be very low, and the effect will be very localized due to the design of the cover	1	1	1	1	1	1	1	1	1	Very Low	Design: Physical barrier leading to prevention of contaminant transport - HDPE liner - 3 m of clean cover rock

RISK NO.	Closure Objective	RISK DESCRIPTION	CONSEQUENCE DESCRIPTION	RISK RATING										CLASSIFICATION	DESIGN AND MITIGATION MEASURES
				Likelihood	Consequence						Max.	SCORE			
					Environmental Impact (EI)	Special Considerations (SC)	Legal Obligations (LO)	Consequence Costs (CC)	Community / Media Reputation (C/MR)	Human Health & Safety (HHS)					
4.9	Ecological Conditions and Sustainability	Vegetation does not grow to required standards to meet land use objectives	Land use objectives are not met, i.e., caribou avoid the area	2	2	1	1	2	1	1	2	4	Low	Mitigation includes: - ongoing monitoring of reclamation success	
4.10	Land Use	See Ecological Conditions and Sustainability													
4.11	Aesthetics	N/A due to mitigations											No Risk	Mitigations include: - 4:1 sloping - re-vegetation to local species (e.g., willows + trees, etc.)	
4.12	Long-term certainty	Regulatory uncertainty around long term management of tailings storage facilities	As a tailings facility, the Class A Storage Facility may require long-term, perpetual monitoring	4	1	1	1	3	1	1	3	12	Medium	Current design includes monitoring up until year 40 Mitigation may need to include bonding for long-term, perpetual monitoring	
4.13	Financial Considerations	See long-term certainty													
Class B Storage Facility													Design includes: - no progressive reclamation because of requirement to maintain a road for the duration of the mine life		
5.1	Physical Stability	Deformation of facility components leading to slumping or localized damage to the cover system (transition closure)	Slow movement of material leading to cracks in cover and increased runoff contact with Class B material and increased seepage	1	1	1	1	2	1	1	2	2	Very Low	Design include: - Foundation preparation will include removal of any unsuitable material - waste rock is free draining (therefore not concerned about how material is placed for stability purposes) - Water Treatment Plant still in place - Class B collection pond still in place Mitigation includes: - Operating the facility in accordance with the OM&S	
5.2	Physical Stability	Deformation of facility components leading to slumping or localized damage to the cover system (post-closure)	Slow movement of material leading to cracks in cover and increased runoff contact with Class B material and increased seepage	1	2	2	1	3	1	1	3	3	Very Low	Post-closure: - Assumes inspections concurrent with the Class A Storage Facility	
5.3	Physical Stability	Global instability	Release of Class B material: slumping of Class B material that does not make it to the creek; contact runoff does make it to the creek.	1	2	2	2	5	3	1	5	5	Low	Design include: - Foundation preparation will include removal of any unsuitable material - waste rock is free draining (therefore not concerned about how material is placed for stability purposes)	
5.4	Chemical Stability	Cover failure (during transition and post-closure phases)	Cover failure leads to infiltration e.g., liner not sealed to spec	2	2	2	1	3	2	1	3	6	Low		
5.5	Chemical Stability	Higher than predicted weather events	No consequence due to design measures										No Risk	Design includes: - Probable Maximum Flood, earthquakes	
5.6	Chemical Stability	Source term predictions under-estimate metal loadings from waste rock	Water quality leaving facility significantly worse than predicted	1	1	1	1	1	1	1	1	1	Very Low	Mitigation includes: - ongoing humidity test work and geochemical model refinement (see AEG, 2019) - Collection pond and Water Treatment Plant in place during transition closure. - Top and bottom liners prevent release	

RISK NO.	Closure Objective	RISK DESCRIPTION	CONSEQUENCE DESCRIPTION	RISK RATING										CLASSIFICATION	DESIGN AND MITIGATION MEASURES
				Likelihood	Consequence						Max.	SCORE			
					Environmental Impact (EI)	Special Considerations (SC)	Legal Obligations (LO)	Consequence Costs (CC)	Community / Media Reputation (C/MR)	Human Health & Safety (HHS)					
5.7	Chemical Stability	Mis-classification of Class A material disposed of in Class B facility	Water quality leaving facility significantly worse than predicted	4	1	1	1	1	1	1	1	4	Low	Mitigations include: - OM&S - Waste Rock and Overburden Management Plan - collection and treatment of water	
5.8	Health and Safety	Uptake of metals to vegetation growing on the cover	Consumption of metals in plants by humans or animals; however, the concentrations will be very low, and the effect will be very localized due to the design of the cover	1	1	1	1	1	1	1	1	1	Very Low	Design: Physical barrier leading to prevention of contaminant transport - HDPE liner - 3 m of cover rock	
5.9	Ecological Conditions and Sustainability	Vegetation does not grow to required standards to meet land use objectives	Land use objectives are not met, i.e., caribou avoid the area	2	2	1	1	2	1	1	2	4	Low	Mitigation includes: - ongoing monitoring of reclamation success	
5.10	Land Use	See Ecological Conditions and Sustainability													
5.11	Aesthetics	N/A due to mitigations											No Risk	Mitigations include: - 3:1 sloping - re-vegetation to local species (e.g., willows + trees, etc.)	
Class C Storage Facility															
6.1	Physical Stability	Localized slope failure	Slow movement of material leading to localized sloughing	1	2	1	1	1	1	1	2	2	Very Low	Design includes: - 3:1 slope - Free draining rock - Material consolidated due to vehicle traffic	
6.2	Physical Stability	Global instability	Slumping of material down slope; would not reach Geona Creek	1	2	1	2	1	1	1	2	2	Very Low	Design includes: - waste rock is free draining (therefore not concerned about how material is placed for stability purposes)	
6.3	Chemical Stability	Mis-classification of Class A or B material disposed of in Class C facility	Results in measurable exceedances of water quality objectives	2	2	1	1	3	2	1	3	6	Low	Mitigations include: - ongoing test work during mining for waste segregation - North CWTS - 1.9 AP/NP cut-off - Factor of Safety >10 - OM&S - Waste Rock and Overburden Management Plan - collection and treatment of water	
6.4	Health and Safety	Uptake of metals to vegetation growing on the cover with roots system growing into the waste rock	Consumption of metals in plants by humans or animals; however, the concentrations will be very low, and the effect will be very localized due to the design of the cover	1	1	1	1	1	1	1	1	1	Very Low	Design: - Overburden + growth medium cover - no tailings stored in facility	
6.5	Ecological Conditions and Sustainability	Vegetation does not grow to required standards to meet land use objectives	Land use objectives are not met, i.e., caribou avoid the area	2	1	2	1	2	1	1	2	4	Low	Mitigation includes: - ongoing monitoring of reclamation success	
6.6	Land Use	See Ecological Conditions and Sustainability													
6.7	Aesthetics	N/A due to mitigations											No Risk	Mitigations include: - 3:1 sloping - re-vegetation to local species (e.g., willows + trees, etc.)	

RISK NO.	Closure Objective	RISK DESCRIPTION	CONSEQUENCE DESCRIPTION	RISK RATING										CLASSIFICATION	DESIGN AND MITIGATION MEASURES
				Likelihood	Consequence						Max.	SCORE			
					Environmental Impact (EI)	Special Considerations (SC)	Legal Obligations (LO)	Consequence Costs (CC)	Community / Media Reputation (C/MR)	Human Health & Safety (HHS)					
Water management structures and systems														Assumes: - post-closure period when all ponds and ditches have been decommissioned - Active and transition phase risks have been captured in the Catastrophic Failure Assessment Report (Minnow, 2017)	
7.1	Physical Stability Chemical Stability	Failure of either of: Class A or B collection ponds or collection ditches (transition period - management ponds have been removed)	Release of contact Class A or B Storage Facility water to Geona Creek valley (physical and chemical downstream effects)	1	3	2	2	3	3	4	4	4	Low	- Foundation preparation - Embankments constructed with rock fill - Lined ponds - Designed to storm events with spillways	
7.2	Physical Stability Chemical Stability	Failure of the constructed wetlands	No consequence as wetlands are contingency only										No Risk	- Monitoring of wetlands through to Year 40 - Wetlands only required as contingency as water quality is acceptable for discharge	
7.3	Chemical Stability	Failure of the Water Treatment Plant	No consequence - collected water would be pumped to the ABM open pit										No Risk		
7.4	Physical Stability	Blockage of ABM lake spillway	Glaciation of spillway and water flows south towards South Lake	4	1	1	1	1	1	1	1	4	Low		
7.5	Physical Stability	Fault Creek returns to South Lake channel	Decreased flow in Geona Creek No consequence if ABM lake is already filled. If ABM lake is not already filled, on-site presence will ensure correct routing										No Risk		
Mine infrastructure (incl. landfill) During Post-Closure														Components remaining at closure: - WTP will continue to run and will require a reduced power load - fuel storage - reduced camp - Waste management facility During Post-Closure: - all mine infrastructure facilities removed - WTP is only removed once stable water quality conditions are achieved	
8.1	Chemical Stability	Mis-classification of Class C	ARD/ML material used for construction. Assume localized issue that can be easily removed	2	2	1	1	2	1	1	2	4	Low	Mitigation: - Factor of safety of >10 for division of Class C and Class B material - OM&S - QA/QC on gravel being crushed for road use - Annual inspections of roads and infrastructure will help identify seeps - Geochemical monitoring (AEG, 2019)	
8.2	Chemical Stability	Landfill leaching to the environment		2	2	1	1	2	1	1	2	4	Low	Design: - Lined facility - Storage areas for open burning, special waste, recycling, used reagent containers, etc. - Lined land treatment facility - Up and down stream groundwater wells to be installed - entire facility to be covered at closure	
8.3	Health and Safety	High concentrations of heavy metals around process plant	No consequence because all material removed										No Risk	Mitigation: - Removal of all contaminated material following removal of infrastructure - Concrete base removed and disposed of in pit - Contaminated material to be trucked off-site	

RISK NO.	Closure Objective	RISK DESCRIPTION	CONSEQUENCE DESCRIPTION	RISK RATING										CLASSIFICATION	DESIGN AND MITIGATION MEASURES
				Likelihood	Consequence						Max.	SCORE			
					Environmental Impact (EI)	Special Considerations (SC)	Legal Obligations (LO)	Consequence Costs (CC)	Community / Media Reputation (C/MR)	Human Health & Safety (HHS)					
8.4	Ecological Conditions and Sustainability	Core racks left on site in perpetuity.	Animals could compromise the stability of the wooden core boxes. Concern around the racks falling into disrepair, leaching metals	2	1	2	1	1	1	1	2	4	Low	- Core racks to be made of metal and covered	
Access Road														Design: - 20 km long Access Road - to be decommissioned near the end of the post-closure (monitoring) period - gate will be manned until reclamation success is confirmed	
9.1	Physical Stability	No significant terrain hazards in area											No Risk		
9.2	Chemical Stability	No ML/ARD concerns with access road											No Risk	See ML/ARD report (AEG, 2019)	
9.3	Land Use	Unauthorized access		4	1	1	1	1	3	2	3	12	Medium	- access unauthorized until Lease expires - Seasonal gate house manning	
9.4	Ecological Conditions and Sustainability	Vegetation does not grow to required standards to meet land use objectives	Land use objectives are not met, i.e., caribou avoid the area	2	2	1	1	2	1	1	2	4	Low	Mitigation includes: - ongoing monitoring of reclamation success	
9.5	Long-term certainty	Regulatory uncertainty	Resource Roads Regulations currently being developed and may change the management regime and structure required for resource roads										No Risk	Cannot predict regulatory changes or the consequences of those changes until the regulations are implemented.	
9.6	Financial Considerations	If long term guard house is required, additional costs might be incurred		3	1	1	1	2	1	1	2	6	Low		
Early Closure (Planned)														- Early closure activities would be similar to LOM closure activities - Bonding would include 2-year + activities, so BMC would be fully bonded for the early closure scenarios - Planned early closure more likely to occur in Year 6 or 7	
10.1	Chemical Stability	With early closure, ABM open pit may fill prior to the treatment wetlands being established	Overflowing of pit water to the environment. Water quality may be worse, as more Class A in the upper horizon of the ABM open pit No consequence due to available mitigations										No Risk	Mitigation: - Conduct ABM open pit treatment with organic biological stimulation - Water Treatment Plant is in place, but may need lower discharge standards to discharge directly to Geona Creek without; or a temporary storage pond may need to be constructed to manage water - Could treat pit with Water Treatment Plant by re-circulation - Could hold off on Fault Creek diversion for 6 months - 1 year to minimize the time for the pit to fill	
10.2	Ecological Conditions and Sustainability	Reclamation research studies not completed	Field studies to refine ABM open pit treatment and constructed wetland treatment system	3	1	1	1	1	1	1	1	3	Very Low	- Facilities are progressively built out and progressively reclaimed - Water Treatment Plant in place to manage water short term while passive treatment systems are refined	
10.3	Socio-economic Expectations	Obligations of the SEPA not fulfilled due to early closure of the mine site	Financial hardship for the community due to loss of expected income										No Risk	Project economics are such that there is no likelihood of this happening	
10.4	Financial Considerations	Bond not sufficient to cover reclamation activities	No consequence because work would be undertaken by the Proponent										No Risk	- Bonding requirements for every two years of operations	

RISK NO.	Closure Objective	RISK DESCRIPTION	CONSEQUENCE DESCRIPTION	RISK RATING										CLASSIFICATION	DESIGN AND MITIGATION MEASURES
				Likelihood	Consequence						Max.	SCORE			
					Environmental Impact (EI)	Special Considerations (SC)	Legal Obligations (LO)	Consequence Costs (CC)	Community / Media Reputation (C/MR)	Human Health & Safety (HHS)					
10.5	Financial Considerations	Bills and debts not paid due to early closure	No consequence because the closure will be planned for, and money will be available to pay all bills and debts										No Risk		
Temporary Closure														- Temporary closure can occur at any time, but may be more likely in Years 3-5 of operations - Temporary closure is a period of no milling or mining for more than 6 months but up to 5 years - Care and maintenance activities include: . Seasonal water treatment of the pit . No removal of facilities - The likelihood of temporary closure is VERY LOW overall	
11.1	Physical Stability	Water ingress into Class A Storage Facility	Water ingress weakens the strength of the stored material Saturation may lead to localized or global instability	2	2	1	2	2	2	1	2	4	Low	NEW MITIGATION: - Apply 1 m glacial till cover to prevent water ingress & oxygen ingress - Should be applied immediately upon temporary closure	
11.2	Chemical Stability	After 6 years, Class A Storage Facility material could start to generate ARD	Water quality may be worse, but all water is collected in the Class A water management pond and then treated in the Water Treatment Plant No Consequence										No Risk	NEW MITIGATION: - Apply 1 m glacial till cover to prevent water ingress & oxygen ingress - Should be applied immediately upon temporary closure	
11.3	Health and Safety	N/A due to mitigations											No Risk	Mitigations: - On-site presence at all times - Gate manned year-round - Occupational Health and safety maintained	
11.4	Land Use	Incremental increase in land use interruption	Longer period when the land is removed from use	5	n/a	1	n/a	1	1	n/a	1	5	Low	- Land use disruption payments would continue during temporary closure	
11.5	Socio-economic Expectations	Interruption in jobs and contracts	Only ~20 jobs during temporary closure compared to 346 during operations	5	n/a	n/a	n/a	2	1	n/a	2	10	Medium	Mitigations: - same as planned early closure - open and transparent communication with stakeholders	
11.6	Long-term certainty	Temporary closure may increase the risk of permanent closure	Permanent closure will be planned - see permanent closure consequences										Very Low		
11.7	Long-term certainty	Regulatory risk during temporary closure	May be forced into permanent closure, or other unknown or changing regulatory environment										No Risk	unable to quantify, could range from minor to major Project costs, and unable to assign likelihood	
11.8	Financial Considerations	Regulatory risk during temporary closure	May be forced into permanent closure, or other unknown or changing regulatory environment										No Risk	unable to quantify, could range from minor to major project costs, and unable to assign likelihood	
11.9	Financial Considerations	Proponent risks due to continued mine site sustaining, but without income	Temporary closure is not considered in Project Economic calculations, therefore the unaccounted for risks may impact the ability of the company to continue to operate	1	n/a	n/a	n/a	4	n/a	n/a	4	4	Low	Mitigation is to NOT go into temporary closure - Generally, the project is less likely to go into temporary closure due to economic robustness of the Project (i.e., 5 metals being produced, and therefore, not as depended on individual metal prices)	

Table A-2: Revised Risk Register for Medium Rated Risks

RISK NO.	Closure Objective	RISK DESCRIPTION	CONSEQUENCE DESCRIPTION	RISK RATING									CLASSIFICATION	DESIGN AND MITIGATION MEASURES	ADDITIONAL MITIGATION MEASURES AVAILABLE	RISK RATING									MITIGATED CLASSIFICATION
				Likelihood	Consequence						Max	SCORE				Likelihood	Consequence						Max	SCORE	
					Environmental Impact (EI)	Special Considerations (SC)	Legal Obligations (LO)	Consequence Costs (CC)	Community / Media Reputation (C/MR)	Human Health & Safety (HHS)							Environmental Impact (EI)	Special Considerations (SC)	Legal Obligations (LO)	Consequence Costs (CC)	Community / Media Reputation (C/MR)	Human Health & Safety (HHS)			
2.5	Health and Safety	Human access	Access to high walls and lake	3	1	1	3	1	3	4	4	12	Medium		Additional mitigation required: - need to prevent access to open pit in winter by snow machines - Double berms have been recommended	2	1	1	2	1	2	2	2	4	Low
4.12	Long-term certainty	Regulatory uncertainty around long term management of tailings storage facilities	As a tailings facility, the Class A Storage Facility may require long-term, perpetual monitoring	4	1	1	1	3	1	1	3	12	Medium	Current design includes monitoring up until year 35 Mitigation may need to include bonding for long-term, perpetual monitoring											
9.3	Land Use	Unauthorized access		4	1	1	1	1	3	2	3	12	Medium	- access unauthorized until Lease expires - Seasonal gate house manning	- full time gatehouse management to ensure no unauthorized access - Fence along highway and connection to Access Road entry	2	1	1	1	1	3	2	3	6	Low
11.5	Socio-economic Expectations	Interruption in jobs and contracts	Only ~20 jobs during temporary closure compared to 346 during operations	5	n/a	n/a	n/a	2	1	n/a	2	10	Medium	Mitigations: - same as planned early closure - open and transparent communication with stakeholders											

APPENDIX B: REVEGETATION TRIAL STUDY SUMMARY 2018

Revegetation Trial Study Summary 2018

1 INTRODUCTION

The overarching objective of the 2017 Conceptual Reclamation and Closure Plan (CRCP) of BMC Minerals (No. 1) LTD's Kudzu Ze Kayah (KZK) Project is "to return the Mine site and affected areas to viable and, wherever practicable, self-sustaining ecosystems that are compatible with a healthy environment and with traditional land use activities" (Alexco Environmental Group, 2017). Several studies will be undertaken over the various stages of the Project to determine the best restoration measures needed to accomplish the goals in the CRCP. A component of these studies includes revegetation with guidance from local practitioners and the Kaska Dena. Successful and appropriate revegetation is a vital component of Mine closure and as such studies are being undertaken at KZK to establish the best approaches to regenerate vegetation covers on disturbed areas.

In 2018, a five year program proposal titled, "2018 Revegetation Trial Study," contained several research questions, details on the installation of revegetation trial sites, and details on a native seed collection program (Access Environmental Group, 2018). This report presents the initial steps taken to establish a revegetation trial program in the Project area in 2018 which includes soil plot analyses, field photos, and program recommendations. Additionally, this report contains:

- Chapter 2: Methods – Outlines the procedures used in selecting trial site locations, site preparations, plot treatments, soil sampling, and native seed collections.
- Chapter 3: Results – A baseline chemical analysis of plot soil samples for nutrients and physical properties follows plus an update on the native plant seed collection program is provided.
- Chapter 4: Discussion – Outlines program challenges and provides recommendations primarily for 2019.

2 METHODS

The following section details the procedures used in establishing the revegetation trial sites, S-1 and S-2, and the native seed collection at KZK.

2.1 Trial Site Selection

The revegetation trial sites, S-1 and S-2, were selected based on the following criteria:

1. A disturbed site within the Project area with topsoil removed;
2. Outside of the proposed Mine footprint, so the site will not be disturbed by construction or operations during the monitoring period over the next five years (i.e., 2018-2022);
3. In the elevation range of the proposed Mine, to monitor plant regeneration under the same climatic conditions as the Mine footprint;
4. The site is well drained, levelled, and homogeneous (i.e., soil and vegetation types are alike throughout the disturbed site);
5. Easily accessed by monitors for observations and treatment adjustments;
6. Wildlife can freely move in and out of the site without impeding their movements;
7. Control of access is possible, so vehicular traffic is not a threat to trial sites; and

8. Surrounding area has an intact natural vegetation community to reduce ingress of invasive species at trial plots.

2.2 Trial Site Preparation

The procedure to prepare and install plots was the same at each trial site, S-1 and S-2. Four 50 m² plots were measured out, staked and labelled at each trial site. The ground was raked, large rocks or debris removed and any regenerating plants in the plots eliminated. Soil sampling consisted of taking five subsamples in each plot, which were combined and well mixed to yield a composite sample per plot for nutrient, mineral and physical properties analysis.

These are the steps involved in trial plot installations:

1. Delineated four 50 m² (e.g., 5 x 10 m) plots with a measuring tape, used wooden stakes to mark corners;
2. Removed large rocks and any remnant vegetation;
3. Raked each plot to break up soil clumps and removed woody debris;
4. Clearly labelled plot treatment type (i.e., control, full fertilization, half fertilization, or organics) and site name on the wooden stakes and flagging attached to the stakes;
5. Recorded soil moisture and the nutrient regime, nearby plant species, wildlife usage and other notable observations (e.g., disturbance type);
6. Collected a composite soil sample of each plot for analyses of elemental profile, nutrient level and conductivity (see section 2.3 for soil sampling methods);
7. Photographed prepared site with identifiable landmarks in the background; and
8. Installed "Do not disturb" and site name signs near the trial sites to discourage anthropogenic disturbances.

2.3 Soil Sampling

Five subsamples were collected from each plot. The soil sampling methods are outlined below for each plot:

1. Cleaned field equipment (i.e., shovels, trowels, and bucket) with distilled water and paper towels;
2. Donned new latex gloves at each plot tested;
3. Dug five soil pits to rooting depth (i.e., 20-30 cm);
4. Collected soil (about ten trowel shovels) from each pit and placed it in a 20 L bucket;
5. Thoroughly mixed soil collected from the plot;
6. Collected a 250 g composite sample and placed the sample into a labelled (e.g., project name, site name, and date) sample bag from each plot;
7. Stored samples in a cooler with ice packs; and
8. Shipped samples to the Maxxam Analytics lab, an accredited lab in Burnaby, BC.

Composite soil samples were analyzed for nutrients, mineral and texture (e.g., grain size). These analytes provide a baseline of the soil characteristics which will enable monitoring of changes and differences in

nutrient cycling due to different treatment efforts. A summary of the analytical results is included in the results section, and the certified lab reports by Maxxam Analytics are attached in Appendix A.

2.4 Plot Treatments

After the soil samples were collected the plots were treated. Each trial site contained four plots with different treatments applied. The following outlines the preparation and steps used for the different treatments:

1. Used a commercial seed supply that was certified weed-free. Weighed seeds based on brand's application rates (for a 50 m² plot) and placed seeds in a Ziploc bag;
2. Weighed fertilizer based on the brand's application rates (for a 50 m² plot) and placed fertilizer in a Ziploc bag;
3. Designated a control plot based on topography which limited runoff from treated plots. Kept plot as is with no treatments applied (i.e., no seeds, fertilizer, or additional organics);
4. Designated a half fertilized plot. Applied seed mix based on application rates with a hand-held broadcaster and applied half the amount of fertilizer based on the brand's application recommendation. Raked in fertilizer;
5. Designated a full fertilizer plot. Applied seed mix based on application rates with a hand-held broadcaster and applied a full application of fertilizer. Raked in fertilizer; and
6. Designated an organics plot. Additional organic soil (i.e., topsoil) from the surrounding disturbed area was scattered evenly throughout the plot; a rake was used to break up soil clumps, and no seeds or fertilizer were applied to this plot.

The commercial grass seed mix used for the trial plots was sourced from DLF Pickseed Canada in Edmonton, Canada. The grass species chosen for the mix are native to the KZK area and accustomed to growing in dry, nutrient-poor soils. All the plots, except the control, received the same amount of grass seeds based on suppliers' application rate. Technical papers were used to determine the number of live seeds per gram for each species. Other information on plant names, percentages and estimated number of seeds applied are shown in Table 2-1.

Table 2-1: Number of Seeds per Grass Species Applied in Trial Plots

Seed Mix	Botanical Name	Percentage	Number of Live Seeds per Gram ¹	Number of Seeds Applied per Plot
slender wheatgrass	<i>Agropyron trachycaulum</i>	37	353	26,122
rough fescue	<i>Festuca campestris</i>	25	654	32,700
Rocky Mountain fescue	<i>Festuca saximontana</i>	25	1498	74,900
tufted hairgrass	<i>Deschampsia caespitosa</i>	13	5510	143,260

¹ Slender wheatgrass and tufted hairgrass are based on a Pickseed technical paper (DLF Pickseed, 2018). Rough fescue and Rocky Mountain fescue are based on a Government of Alberta technical paper (Government of Alberta, 2001).

Grass seeds were applied to trial plots based on the supplier's recommended 32 kg/hectare which was calculated² to 0.20 kg/plot (i.e., $[32/10,000 = (0.0032)50]$). The percentage of seeds in the mix is based on weight. As the weight of seeds varies among species, there are a higher number of lighter, smaller seeds (e.g., tufted hairgrass) per unit of weight than the larger, heavier seeds (e.g., slender wheatgrass). This is assuming that the seed lot tested 100% for both germination and purity as noted on seed bags by Pickseed Canada (DLF Pickseed, 2018). Larger seeds are more robust and have a better chance of germinating than the smaller seeds. Larger seeds can also remain dormant for longer periods then germinate when growth conditions are favourable (Matheus & Omtzigt, 2013).

A Pure Live Seeds (PLS) calculation was applied to better understand rates of germination and survival of seeds per species for the 50 m² trial plots. The PLS is the number of seeds that are expected to germinate based on the seed provider's agricultural research (DLF Pickseed, 2018).

C-I-L fertilizer with a nutrient N-P-K ratio of 18-4-6 was applied to half the plots. This fertilizer was selected as it was high in nitrogen and contained a gradual release formula. The fertilizer was applied at a rate of 750 kg/ha which calculates to 0.075 kg/m², so fully fertilized plots received 3.75 kg of fertilizer and half fertilized plots were given 1.875 kg. The granular fertilizer was applied by the hand-held broadcaster. After the seed and fertilizer were applied, they were hand-raked into the ground to increase seed contact with the soil and to reduce runoff. The various treatments are summarized in Table 2-2.

Table 2-2: Site S-1 and S-2 Trial Plot Treatments

Plot	Treatments	Seed Mix (kg/50 m ²)	Applied Fertilizer (kg/50 m ²)
Control	Left as is with no seeds, fertilizer, or organics applied	0	0
Half Fertilizer	Applied seeds and 1/2 recommended fertilizer	0.2	1.875
Full Fertilizer	Applied seeds and fertilizer	0.2	3.75
Organics	Applied seeds, no fertilizer	0.2	0

2.5 Native Seed Collection

In consultation with Kaska First Nations, Yukon government, and consultants, it is recommended to use seeds and cuttings from plants native to the KZK Project area during reclamation. Literature from reclamation and restoration research provides compelling evidence that native plants from self-sustaining plant communities do not require much maintenance and reduce the risk of introducing invasive species (Matheus & Omtzigt, 2013). Additionally, native plant species are more adaptable to growing in nutrient deficient soils than agronomic (i.e., industrialized) plant species (Minto Explorations Ltd., 2017). Finally, culturally important plants for the Kaska are a vital component to the reclamation of KZK.

A select group of grasses, forbs, scrub birch and willows species were picked in late August and September as the harvested species depended on seed availability and accessibility. These selected plant species are good candidates for revegetation trials and are culturally important for traditional uses. These seeds and others will be tested for their validity in the reclamation program.

² Rounded from 0.16 kg/plot to 0.20 kg/plot.

2.5.1 Grasses and Forbs

The following tasks were completed during the late summer and early autumn of 2018:

1. Areas were identified for native plant seed collections near the Project Footprint;
2. Students from the Yukon College's Environmental Monitoring program and KZK staff harvested grass and forb seeds from the identified areas;
3. Seeds were placed in labelled (species' name, collection date, and location) lunch-sized paper bags (5 1/8" x 3 1/8" x 10 5/8"); and
4. Seeds were dried in a drying room at KZK and stored for future use in 2019.

All seeds collected were handpicked and collected from native plant species in various subalpine environments on days with no precipitation. These subalpine regions included areas around the KZK camp, climate station, site S-1, and site S-2.

Grass inflorescences (i.e., group of flowers) were collected by snapping the spike containing the inflorescence off from purple reedgrass (*Calamagrostis purpurascens*), northern rough fescue (*Festuca altaica*), Alpine bluegrass (*Poa alpina*), and Alpine sweetgrass (*Hierochloa odorata*). Also, fruits from northern goldenrod (*Solidago multiradiata*) were collected in the same manner. Tilesius' wormwood (*Artemisia tilesii*) and mountain sagewort (*Artemisia norvegica*) seeds were handpicked directly from the seed heads.

2.5.2 Willow Species and Dwarf Birch

Willow stakes from little-tree willow (*Salix arbusculoides*) and felt-leaf willow (*Salix alaxensis*) were harvested in September 2018. As well as a culturally important species, scrub birch (*Betula glandulosa*) catkins (i.e., cylindrical flower clusters) were collected. Willow stakes and catkins were collected with the following procedure:

5. Flagged healthy looking willows that were relatively straight and about 2 to 4 cm in diameter;
6. Browsed willows were also selected as they are more resilient to browsers;
7. Harvested dormant willows meaning when about half the leaves had fallen off;
8. Cut the base of a willow stake with a clipper at an angle with a horizontal cut on top of the stake;
9. Debranched the stakes and cut to length about 0.5 to 1.5 m;
10. Willow species that are recommended for live staking were located, marked, harvested (when the leaves had mostly dropped) and stored in dry cold storage for spring planting at the revegetation site;
11. Scrub birch catkins were handpicked and stored in labelled (species' name, collection date, and location) paper bags (5 1/8" x 3 1/8" x 10 5/8") to overwinter;
12. Catkins were collected by hand pulling them directly off the branchlets;
13. Catkins were dried for a few days by storing them in the drying room located at the KZK camp; and
14. Bags of catkins were kept in cardboard boxes and stored in a dry, dark storage area for winter.

3 RESULTS

The following section includes trial site descriptions, a revegetation map, ecosystem classifications, photographs of the program, soil analysis results, and a summary of the native seed collection.

3.1 Descriptions of Trial Sites

In 2018, two sites were chosen for the revegetation trials. At each of these sites, there are four plots established. The first revegetation site is referred to as S-1. The “S” denotes that the site is in the subalpine bioclimatic zone or the site can also be referred to as Subalpine-1. The S-1 site is approximately 1 km directly northeast of the KZK camp on a decommissioned portion of an exploration trail (Figure 3-1). The second site, S-2 site or Subalpine-2, is just south of Fault Creek and approximately 75 m south of the junction of the creek and Tote Road (Figure 3-1). The S-2 site is situated on a decommissioned 2015 drill pad (i.e., drill holes K15-329 and K15-332).

Site characteristics on the two revegetation trial sites are provided in Table 3-1, which includes a brief description of surrounding plant communities and the corresponding Terrestrial Ecosystem Map (TEM) polygon classifications which are based on plant community profiles, nutrient and moisture regimes.

Table 3-1: Trial Site Characteristics

Variables	Site S-1	Site S-2
Location (UTM)	09V E 0414175, N 68202400	09V E 0414797, N 6814635
Elevation (masl)	1324	1420
Bioclimate Zone	Subalpine	Subalpine
Slope (%)	<5	<5
Aspect (°)	50	82
General Soil Characteristics	Sandy loams, slightly acidic (pH 5.94 to 6.24), poor nutrient content	Loamy sands, low nutrient (NPS) content marginally better than site S-1, but more acidic (pH 4.9 to 5.65)

3.2 Terrestrial Ecosystem Map

In 2016, a Terrestrial Ecosystem Map (TEM) was created to decipher various plant communities at KZK based on plant compositions, nutrient and moisture regimes (Alexco Environmental Group, 2016). According to the TEM, each trial site is in a Subalpine Unit 01 ecosystem, although site S-2 is in an earlier successional stage polygon. The subalpine Site Unit 01 classification is a zonal ecosystem that best reflects the regional climate and is least influenced by the local topography and soil properties (Klinka, Green, Meidinger, & McLennan, n.d.). Both trial sites have similar physical and chemical characteristics, coarse-grained acidic soils with poor nutrient supply due to the removal of topsoil. The slopes at each site are very gentle and facing east which is the best situation to create trial sites where germination, growth, and survival can be determined for the regional climate type. The eastern aspect is considered neutral, avoiding northern or southern solar extremes (Matheus & Omtzigt, 2013).

3.2.1 Site S-1

The S-1 trial site is in Polygon 96 according to the TEM (Alexco Environmental Group, 2016). This polygon contains three ecosystem types, the S-1 trial plots are within the most common ecosystem of the three. This ecosystem is classified as Site Unit 31, meaning on average the soils are of medium to poor (relative) nutrient levels and sub-hygic (fresh) moisture content. Using the edatopic grid on the TEM, the Soil Nutrient Regime (SNR) is equal to "C" or "B", and the Soil Moisture Regime (SNR) is equal to 5 or fresh.

The vegetation code for this polygon is FSwRhEsFmLi-3a (subalpine fir – white spruce – Labrador tea – scrub birch – feather moss – lichen sp. – low shrub) which mostly matches the vegetation profile of the plant community surrounding the S-1 trial site. More specifically the area is an open forest of mature white spruce (*Picea glauca*). Dominant shrubs are scrub birch (*Betula glandulosa*), willows (*Salix* sp.), and Labrador tea (*Rhododendron tomentosum*). The ground cover consists of grasses (*Festuca altaica*, *Calamagrostis purpurascens*), feather mosses and a variety of forbs including Arctic lupine (*Lupinus arcticus*), northern goldenrod (*Solidago multiradiata*), tall bluebell (*Mertensia paniculata*), crowberry (*Empetrum nigrum*) and other representative species of the site unit.

The regenerating plant species in S-1 plots are noted as Curley's sedge (*Carex rupestris*), fireweed (*Chamerion angustifolium*), willow herb (*Epilobium latifolium*), common horsetail (*Equisetum arvensis*), and small-flowered woodrush (*Luzula parviflora*).

3.2.2 Site S-2

The S-2 trial site is in Polygon 33 according to the TEM (Alexco Environmental Group, 2016). This polygon is classified as Site Unit 01, meaning on average the soils are of medium nutrient levels and mesic moisture content.

The vegetation code for the polygon is EsWiFm-3a (scrub birch – willow – feather moss – low shrub) which generally matches the vegetation profile of the plant community surrounding the S-2 trial site. More specifically the area near the plots has primarily tall willow (*Salix* sp.) with less than 5% cover of scrub birch (*Betula* sp.). The ground cover consists of many forbs and grasses rather than feather moss. Forbs included fireweed (*Chamerion angustifolium*), tall larkspur (*Delphinium glaucum*), mountain sagewort and Tilesiu's mugwort (*Artemisia norvegica* and *tilesii*), Arctic lupine (*Lupinus arcticus*), northern goldenrod (*Solidago*

multiradiata), and tall bluebells (*Mertensia paniculata*). No remnant vegetation was left at S-2 due to clearing before plot establishment.

The S-2 site is situated on an active alluvial fan of which its most recent debris flood occurred between 1986 to 1992 (Coregeo and Associates, 2017). Consequently, the vegetation community is at an earlier succession stage than S-1. Some vegetation was naturally regenerating on the site, but no intentional grass seeding was apparent. The site was then cleared by a bulldozer and levelled in the fall of 2018 for the revegetation trial setup.

3.3 Plot Installation

In these trials, a commercial seed mix was applied to treatment plots. This dryland seed mix has been used at the KZK Project to revegetate disturbed areas, such as old drill pads and trails. To date, the seeds are growing abundantly in areas with soils that have visibly high organic content.

The plot installation process containing before and after photographs for site S-1 is in Figure 3-2 for site S-2 is in Figure 3-3.

Figure 3-2: Photographs of Site S-1 Before and After Trial Plot Preparation

Site S-2 before plot preparation on August 30, 2018.

Site S-2 after plot preparation on September 12, 2018.

3.4 Soil Sample Analyses

3.4.1 Types of Plant Nutrients

There are a variety of types of nutrients that plants require for growth such as essential nutrients, macronutrients, and micronutrients. Essential plant nutrients include carbon, oxygen, and hydrogen which are absorbed from the air, whereas other nutrients including nitrogen are typically obtained from the soil (Bidlack & Jansky, 2014). The following macronutrients are absorbed through root systems from soil: nitrogen (N), phosphorus (P), potassium (K), calcium (Ca), sulphur (S), and magnesium (Mg) (Matheus & Omtzigt, 2013). Micronutrients (or trace minerals) required by plants include iron (Fe), boron (B), chlorine (Cl), manganese (Mn), zinc (Zn), copper (Cu), molybdenum (Mo), and nickel (Ni). These elements also exist as salts in soils, so plants consume these elements as ions (Bidlack & Jansky, 2014).

3.4.2 Available Nutrients and Properties of Soil Plots

The composite soil samples collected for each plot at both S-1 and S-2 sites were submitted to Maxxam Analytics to determine the number of nutrients and Total Organic Carbon (TOC) available in the growth substrate (i.e., soils). A metal profile is supplied that shows the number of micronutrients plus other metals existing in the soil. Some plants can absorb heavy metals from the soil, so a baseline of these concentrations is needed to determine if certain plants are translocating certain metal ions over time and if these plants are palatable to herbivores (Matheus & Omtzigt, 2013). Soil nutrients and properties of the revegetation plots are noted in Table 3-2.

Table 3-2: Soil Nutrients and Properties of Revegetation Plot Soils

Analysis Type		Site S-1				Site S-2			
	Units	Control Plot	Half Fertilizer	Full Fertilizer	Organics	Control Plot	Half Fertilizer	Full Fertilizer	Organics
Nutrients									
Nitrogen (N)	mg/kg	<2.0	<2.0	<2.0	<2.0	<2.0	<2.0	<2.0	<2.0

Silt	%	25	31	37	36	20	15	11	16
Clay	%	2.1	7.3	9.4	9.6	5.3	5.0	3.8	4.8
Texture	N/A	Loamy Sand	Sandy Loam	Sandy Loam	Sandy Loam	Sandy Loam	Loamy Sand	Loamy Sand	Loamy Sand
Soil Properties									
Calcium Carbonate Equivalent	%	<0.6	<0.6	<0.6	<0.6	<0.60	<0.60	<0.60	<0.60
Soluble (2:1) pH	pH	6.77	6.74	6.99	6.90	5.76	6.18	6.44	6.06

TOC influences many soil characteristics including colour, nutrient holding capacity (i.e., cation and anion exchange capacities), nutrient turnover, moisture retention and aeration (Brady & Weil, 2010). Organic carbon provides a food source for microorganisms and helps improve stability through microorganisms binding soil particles together into aggregates or peds (DeLuca & Boisvenue, 2012). Additionally, bacteria excretions, root exudates, fungal hyphae, and plant roots can all contribute to better soil structure (Huang & Schoenau, 1996).

Comparing TOC results from KZK, the lab analysis indicates that most of the trial plots' carbon content is low, ranging from 3,300 mg/kg to 27,000 mg/kg. This is not surprising as the topsoil that would contain most of the TOC has been removed. Carbon levels are expected to increase over trial time from the introduction of vegetation.

3.4.3 Macronutrients and Micronutrients

The lab's soil analysis shows that the level of macronutrients (N, P, K, and S) at the KZK revegetation plots are very low. The topsoil which is the reservoir for these nutrients and organic carbon has been mostly removed, along with the populations of fungi and microorganisms that are necessary for nutrient cycling.

The revegetation trials enable Project management to understand what soil amendments will work best to ensure revegetation efforts are successful during progressive and closure reclamation. A soil metal profile which includes macro- and micronutrients is in Table 3-3. Additionally, more details on the importance of macronutrients follow:

- Plants require more nitrogen (N) than any other nutrient, but only a small portion of the nitrogen in the soil is available to plants; 98% of the nitrogen in the soil is in organic forms (Bidlack & Jansky, 2014). Soil microorganisms convert organic forms of nitrogen to mineral forms when they decompose organic matter and fresh plant absorb residual forms of nitrogen. This why it is necessary to provide fertilizer to poor nutrient soils to initiate plant growth till plant decomposition begins to provide a level of N-P-K to self-sustain (DeLuca & Boisvenue, 2012). In sandy soils, such as the KZK trial plots, an adequate soil nitrogen supply is between 25 to 50 mg N/kg soil (Brady & Weil, 2010).
- Potassium is an essential plant nutrient and is required in large amounts for proper growth and reproduction of plants (Bidlack & Jansky, 2014). Potassium is considered second only to nitrogen, when it comes to nutrients needed by plants, as it affects the plant shape, size, colour, taste and other measurements attributed to healthy produce. Plants absorb potassium in its ionic form (K+) (Matheus & Omtzigt, 2013).
- Sulphur (S) is an essential plant nutrient, necessary for protein synthesis and the formation of chlorophyll (Matheus & Omtzigt, 2013). Organic matter is the primary source of sulphate (SO₄-S) for plant uptake. Soils that are sandy, low in organic matter and found in upper to mid-slope positions are especially prone to sulphur deficiency since the small amount of SO₄-S released from organic matter is susceptible to leaching loss (Brady & Weil, 2010). The higher concentration of inorganic sulphur found in soil samples is likely being contributed by bedrock mineralization.
- Phosphorous is used by plants to form new roots and is important for the development of seeds which requires large amounts for proper growth and reproduction of plants (Flanagan & Van Cleve, 1983).

Macronutrients are highlighted in light green.

3.5 Native Seed Collection

Approximately 30 field hours went into this year's seed collection program including the willow stake harvest. Seed collection was assisted by First Nations students (Yukon College's Environmental Monitoring Program), and four Elders from Ross River and Watson Lake, Yukon. Grass seeds were collected from the climate station. Most of the forb species seeds were collected from the S-2 site before it was levelled by a bull-dozer in preparation for the revegetation trial plots. Overall, about 30 bags worth of seeds were collected and are currently stored on site. Finally, about thirty willow stakes were harvested from around the S-2 trial site and Fault Creek. A summary of the native seed collection is in Table 3-4 and photographs of the seed collection are in Figure 3-4.

Table 3-4: Native Seed Collection Summary

Collection Site	Common Name	Botanical Name	Weight of Seeds
Site S-1	scrub birch	<i>Betula glandulosa</i>	0.029 kg
Site S-2	mountain sagewort	<i>Artemisia norvegica</i>	0.006 kg
	Tilesius' wormwood	<i>Artemisia tilesii</i>	0.082 kg
	rough fescue	<i>Festuca campestris</i>	0.020 kg
Kudz Ze Kayah camp	northern goldenrod	<i>Solidago multiradiata</i>	0.046 kg
	rough fescue	<i>Festuca campestris</i>	-
Climate station	purple reedgrass	<i>Calamagrostis purpurascens</i>	0.045 kg
	Alpine bluegrass	<i>Poa alpina</i>	0.002 kg
	Sweetgrass	<i>Hierochloe hirta</i>	0.004 kg
	Piper's wood-rush	<i>Luzula piperi</i>	0.004 kg
	scrub birch	<i>Betula glandulosa</i>	-
Total weight			0.238 kg

Figure 3-4: Photos of Seed Collection and Storage

Seed Collection	Location
 Grass seed harvesting near the weather station.	 Seed gathering south of weather station.
 Local field assistant, Robby Dick, collecting willow stakes near the Subalpine-2 site.	 Dried seeds in winter storage at KZK Camp.

4 DISCUSSION

The following table, Table 4-1, summarizes the 2018 activities undertaken at KZK which correspond to the program's research questions found in the 2018 Revegetation Trial Study proposal (Access Environmental Group, 2018). Furthermore, planned 2019 activities are included in the table.

Table 4-1: Research Questions for Revegetation Study

Research Questions	2018 Activities	2019 Activities
What is the success rate on trial plots in fall/frost seeding and what are the corresponding soil characteristics?	Developed two revegetation trial plots in subalpine ecozones. Add more revegetation sites in 2019.	Use monitoring forms to document plant growth. Look for invasive plants and remove if any are found (document). Measure shoot-to-root ratios. Measure per cent covers and other variables (e.g., soils after die back, meteorological data collected for the growing season, vegetative cover, seeded species composition, natural colonization of other species etc.). Photograph from fixed points.
What is the success rate for willow staking on various sites?	Stockpiled willow stakes from two willow species (little-tree and felt-leaf)	Plant willow stakes in moist soils, on slopes. Harvest and plant additional willow species for testing. Monitor left growth after planting.
What is the success rate of fertilized trial plots?	Willow cuttings stockpiled. Plant and monitor growth rates in 2019.	Collect annual soil samples from trial sites and collect vegetation samples to determine metal uptake.
How much natural native plant regeneration occurs at both trial sites?	Documented growth at S-2 from 2015 drill site. Monitor controls at S-1 and S-2.	Continue monitoring S-1 and S-2 control sites. Formally assess seeded areas.
What grass, legume, and shrub seeds can be best collected at the site that are good revegetation candidates?	To be determined in 2019. Continue with seed collection. Dry seed mixture applied to S-1 and S-2.	A variety of seeds (up to 50 species) have been identified as possible candidates to collect seeds from. Will need to determine viable areas around KZK for seed collections.
When is the best timing and method to collect seeds from each species?	Dependent on species. Forbs likely in June/July. Grass species from July to August. Scrub birch catkins in late August-early September. Willows harvested in late September. Continue with research and monitoring.	Additional species will be collected in 2019 to determine collection periods at KZK.
What is the success rate for shrub species propagation with an external nursery?	To be determined in 2019. Need to identify available nurseries.	Support greenhouse initiative with Dena Cho. Identify local nurseries.

4.1 Challenges

Trial site selection was the most challenging part of the 2018 research program as most of the drill pad areas had been revegetated or were near the Tote Road where ongoing disturbance is expected during the life of the Project. At this point in the revegetation research, trial sites need to be in areas that are representative of the average growth conditions for testing germination and survival of selected plant seeds.

As this was the first year of collecting seeds at KZK, there were a few challenges. For instance, rain often limited the seed collection efforts, since it was not ideal for picking. Further, the collection time and having a few people dedicated to identifying and collecting seeds limited the collection efforts and the variety of seeds collected. Most seeds such as lupines, locoweed, mountain avens, louseworts, and Jacob's ladder, and arnica had dispersed by September. Also, the collection effort was limited by commitments to other KZK programs.

4.2 Program Recommendations for 2019

Another avenue of investigation is to test the viability of locally sourced seeds to regenerate native plants that have evolved to grow in the KZK area. This would require time to harvest, clean and prepare seeds of local plants considered good candidates for revegetation. Some local native plant seeds have already been harvested in 2018 and are stored at the KZK camp. Next season the native seed harvest program can be expanded, and more trial programs can be developed to test their regeneration capabilities. Other recommendations are:

- Proactively search for potential revegetation trial sites by noting areas that are or will be disturbed outside of planned Project Footprint;
- Involve Kaska Dena people in revegetation efforts to integrate traditional and local knowledge of KZK area and input into revegetation trial development;
- Native seed harvesting needs to be undertaken throughout the summer as selected plants mature at different times and there should be a focus on pioneering species (see Appendix B);
- Find nurseries to collaborate with on seed preparation, rearing of certain seedlings and growth enhancement methods;
- Monitor trial sites and plots throughout the growing seasons with the following steps:
 - Determine germination success rates of grass species at trial plots;
 - In late summer, measuring per cent cover of each plot overall and per species, use a 1 m² grid as an aid;
 - Select several mature grass samples per species from each plot and measure root and shoot lengths to ascertain a shoot-to-root ratio⁴;
 - Note general appearances of grass species grown in each plot (e.g., colour, size, stem, leaf and seed growth);

⁴Shoot-to-root ratio is a common means of determining the amount of plant tissues that have supportive functions to the amount of those that have growth functions. Plants with a higher proportion of roots can compete more effectively for soil nutrients, while those with a higher proportion of shoots can collect more light energy (Ericsson, 1995).

- Document evidence of wildlife or insect interaction with revegetation plots (e.g., tracks, scat, browsing, diggings, dens or nests);
 - Document evidence of disease or other pathology;
 - Take photographs of plots and individual plants to record growth characteristics, use a ruler for scale;
 - The occurrence and per cent cover of naturally colonizing plant species; and
 - Document and then remove any invasive plants found in and around plots;
- Collect soil samples from plots to evaluate nutrient cycling and physical characteristics by analysing for nutrient, physical and metal profiles;
- Conduct a mid-summer inventory of indigenous plant species in the area that may be used for revegetating disturbed areas at KZK;
- Future seed and fertilizer treatments should be formulated based on the results of the 2018 trial sites, available seeds, soil analysis and site conditions;
- Apply a dry seed mix to dry areas and a wet area seed mix for riparian sites;
- Optimize prescriptions of revegetation species mixes, integrating Kaska traditional knowledge for the area with Yukon revegetation guidance and commercially available naturalized species;
- Research germination and propagation techniques used by nurseries and start a propagation program to produce seedlings for trial sites at KZK, likely either in Ross River;
- Continue discussions on culturally important plants with Elders from Ross River and Watson Lake to ensure community involvement, input, and support;
- Have more field assistants including youth and Elders for next year's seed collection;
- Connect with the Yukon Research Centre (YRC) and other territorial based agencies for possible program collaboration and guidance in the revegetation program;
- Continue literature review and Kaska ethnography research;
- Document plant growth from reclaimed areas at KZK;
- Create herbarium with native plant specimens collected at KZK;
- Develop a work plan for the 2019 season and outline the steps needed to achieve the program's goals;
- Install additional sites in riparian areas near the South Lakes and the high boreal ecozone;
- Dedicate an area at KZK for seed storage and processing;

5 CONCLUSIONS

By the 2017 Conceptual Reclamation and Closure plan for the KZK Project, a revegetation research program was initiated to begin the process of developing a customized approach to reclamation at the proposed Project Footprint. The revegetation research will integrate traditional knowledge of the Kaska Dena, latest reclamation techniques, locally sourced vegetation and soil building enhancements. Collaboration with other agencies involved in northern reclamation endeavours will be an important component of the Project as innovations are tested at other Mine sites and through related research that addresses the challenges of reclamation of disturbed sites in northern climates.

The revegetation program will be expanded in the future; local seed harvesting efforts will increase, so a diversity of local plants can be tested for suitability. At this point, the test plots are in mesic areas with low nutrient soils which primarily reflect regional climatic growth conditions. Eventually, test site selection will include a wider spectrum of growth conditions such as wetter and dryer areas at KZK.

Recommendations included in the report are guidelines to further the revegetation investigations and provide methods for data collection to help determine best practices towards successful revegetation efforts.

N/A = Not Applicable

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

QC Standard: A sample of known concentration prepared by an external agency under stringent conditions. Used as an independent check of method accuracy.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

Remarks:

Maxxam Analytics' laboratories are accredited to ISO/IEC 17025:2005 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing. Maxxam is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by Maxxam, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

Encryption Key

Please direct all questions regarding this Certificate of Analysis to your Project Manager.

Remarks:

Maxxam Analytics' laboratories are accredited to ISO/IEC 17025:2005 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

CERTIFICATE OF ANALYSIS

MAXXAM JOB #: B879462

Received: 2018/09/14, 11:40

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing. Maxxam is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by Maxxam, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) This test was performed by Maxxam Calgary Environmental

(2) This test was performed by Maxxam Ontario (From Burnaby)

N/A = Not Applicable

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

QC Standard: A sample of known concentration prepared by an external agency under stringent conditions. Used as an independent check of method accuracy.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

(1) Reference Material exceeds acceptance criteria for Ag. Reanalysis yields similar results.

Remarks:

Maxxam Analytics' laboratories are accredited to ISO/IEC 17025:2005 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing. Maxxam is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by Maxxam, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

Appendix B: List of Pioneering Plant Species for Seed Harvesting

Restoration Candidate Plant Species for the Kudz Ze Kayah Project

The benefits of using native grass and forb seed in your project are:

- Native grasses and forbs provide a good source of forage for both domestic livestock and wildlife;
- At high elevations, native species are adapted to the short, harsh growing seasons where domestic grasses do not grow well;
- Native grasses and forbs are generally better adapted to low nutrient conditions; and
- and need fewer inputs to establish and maintain a vigorous stand.

The plants listed below have been observed in the Kudz Ze Kayah (KZK) study area and are referenced in the Yukon Revegetation Manual as candidates for northern revegetation projects. Site condition preferences of plants and usages can be further investigated.

This list is not exhaustive; further research will lead to the addition of other native plant species that are in the KZK area and can be utilized in revegetation efforts.

Grasses:

<i>Poa alpina</i>	Alpine bluegrass
<i>Anthoxanthum monticola</i>	Alpine sweetgrass
<i>Festuca altiai</i>	Altai fescue
<i>Beckmannia syzigachne</i>	American sloughgrass
<i>Poa palustris</i>	Fowl bluegrass
<i>Poa glauca</i>	Glaucous bluegrass
<i>Arctagrostis latifolia</i>	Polargrass
<i>Calamagrostis purpurascens</i>	Purple reed grass
<i>Festuca saximontana</i>	Rocky mountain fescue
<i>Elymus trachycaulus</i>	Slender wheatgrass
<i>Trisetum spicatum</i>	Spike trisetum
<i>Agrostis scabra</i>	Ticklegrass
<i>Deschampsia caespitosa</i>	Tufted hairgrass
<i>Elymus alakanus</i>	Violet wheatgrass

Forbs:

<i>Achillea millefolium</i>	Common yarrow
<i>Achillea sibirica</i>	Siberian yarrow
<i>Artemisia norvegica</i>	Mountain sagewort
<i>Artemisia tilesii</i>	Aleutian mugwort
<i>Chamerion angustifolium</i>	Fireweed
<i>Lupinus arcticus</i>	Arctic lupine
<i>Rumex arcticus</i>	Arctic dock
<i>Solidago multiradiata</i>	Northern goldenrod

Appendix B: List of Pioneering Plant Species for Seed Harvesting

Ground Covers (low growing shrubs):

<i>Arctostaphylos rubra</i>	Bearberry
<i>Arctostaphylos uva-ursi</i>	Kinnikinnick
<i>Dryas octopetala</i>	Eight-petal Mountain-avens
<i>Empetrum nigrum</i>	Crowberry
<i>Vaccinium uliginosum</i>	Bog blueberry
<i>Vaccinium vitis-idaea</i>	Lingonberry

Shrubs:

<i>Picea glauca</i>	White spruce
<i>Populus balsamifera</i>	Balsam poplar
<i>Betula papyrifera</i>	Paper birch
<i>Betula glandulosa</i>	Dwarf birch
<i>Potentilla fruticosa</i>	Shrubby cinquefoil
<i>Rhododendron groenlandicum</i>	Labrador tea
<i>Rosa acicularis</i>	Prickly rose
<i>Salix alaxensis</i>	Felt-leaf willow
<i>Salix arbusculoides</i>	Little tree willow
<i>Salix arctica</i>	Arctic willow
<i>Salix glauca</i>	Grey-leaf willow
<i>Salix planifolia</i>	Diamond-leaf willow
<i>Salix Polaris</i>	Polar willow
<i>Shepherdia canadensis</i>	Soapberry

Trees:

<i>Picea glauca</i>	White spruce
<i>Picea mariana</i>	Black spruce
<i>Populus balsamifera</i>	Balsam poplar
<i>Populus tremuloides</i>	Trembling aspen

EXECUTIVE SUMMARY

BMC Minerals (No.1) Ltd. (BMC) is proposing to develop the Kudz Ze Kayah Mine Project (the Project) in southeast Yukon, Canada. The Project will entail the creation of an open pit which will fill with water from Fault creek, groundwater, and surface runoff to create ABM Lake. While the ABM Lake water is predicted to have circumneutral pH, water quality modelling suggests that it may contain elevated constituents of potential interest (COPI) at closure (AEG, 2018). As such, *in situ* treatment of the ABM Lake is proposed to be initiated during lake formation to help reduce elevated COPI levels. Without treatment eight COPIs (arsenic, antimony, cadmium, copper, lead, selenium, uranium, and zinc) are expected to be elevated in ABM Lake relative to water quality objectives proposed for the receiving environment (AEG, 2018; AEG and Minnow, 2020) and proposed mitigation of these COPIs in the ABM Lake form the focus of the reporting described herein. The proposed *in situ* treatment process is an organic carbon injection to stimulate native microorganisms which will then form reducing conditions in the water column. These conditions will transform certain elements, such as selenium and uranium, into insoluble forms, and will precipitate chalcophile elements such as antimony, cadmium, copper, lead, and zinc as poorly soluble sulphide minerals. The insoluble phases formed will settle to the lake bottom for long term storage.

Overall, this testing has demonstrated that effective COPI removal can be achieved by organic carbon addition to ABM Lake water, consistent with the documented successful full field scale application of this technology at other North American pit lakes. Ferric iron addition with attendant mixing can also lower arsenic concentrations in ABM Lake to provide additional benefit to *in situ* treatment.

This report summarizes pilot-scale test work completed by Ensero Solutions Canada, Inc. (formerly known as Alexco Environmental Group Inc. [AEG]) to evaluate the dosage of organic carbon and the effects of soil amendment and temperatures on the efficacy of the proposed *in situ* treatment. This included 8 trials which were performed using 200 L barrels containing synthetic water that has a water chemistry consistent with the modelled chemistry of ABM Lake, amended with crushed waste rock to reflect the exposed rock surfaces in the open pit. Stage 1 of the testwork operated for 34 weeks during which glycerol was added to the trials to assess COPI removal under reducing conditions. Organic carbon was consumed by microbes, which resulted in reducing conditions and generally the lowest concentrations of antimony, cadmium, copper, lead, selenium, uranium, and zinc concentrations by the end of Week 14. The addition of 10 kg of soil in two carbon amended trials (Trials 3 and 4) resulted in comparable treatment for most COPIs during reducing conditions to that observed in Trials 1 and 2 which received a smaller 10 g of soil inoculum. At lower temperatures (5°C), reducing conditions were slower to be established, due to slower microbial metabolism at the lower temperature, which in turn resulted in the slower decrease of COPI concentrations compared to those trials operating at room temperature. COPI removal was lower if trials became carbon limited, which resulted in lowered treatment performance in Trial 1 and 6. Overall, the COPI removal percentage observed was similar to or higher than the assumed inputs to the water quality model, validating the model assumptions for *in situ* treatment of ABM Lake. Post-experiment testing indicated the formation of acid volatile sulphides, reflecting reducing conditions achieved during the test work. The microbiology test work indicated beneficial sulphide-producing, selenium-reducing, and uranium-reducing bacteria established in the trials with the addition of carbon, and the establishment was not inhibited at lower temperatures or with higher COPI concentrations.

As expected, arsenic concentrations were not lowered under the reducing conditions during Stage 1. Therefore, ferric iron dosing was investigated in Stage 2 of the *in situ* treatment trials over a 12 week period. Ferric iron, as ferric sulphate, was added using 10:1 and 20:1 iron to arsenic ratios (by mass) to the pilot-scale barrel trials either before or after carbon addition to evaluate arsenic removal in the presence of elevated iron under both oxidizing and reducing conditions. Ferric iron addition resulted in removal of approximately 40% to 65% of total arsenic as the iron hydrolyzed to form ferric (oxyhydr)oxide particles that scavenged arsenic from solution. Increased removal was observed for

dissolved arsenic using the 20:1 iron to arsenic ratio, indicating that the lower total arsenic removal is related to the presence of arsenic-bearing particulates in the water column; therefore additional settling time may improve total arsenic removal. Although the order of ferric and carbon dosing did not appear to influence the maximum total arsenic removal observed, greater removal of dissolved arsenic was observed at the end of Trial 5, which received ferric iron first under oxidizing conditions before transitioning to reducing conditions following carbon amendment. Ferric iron addition under oxidizing conditions resulted in minimal additional removal of other COPIs; however, subsequent transition to reducing conditions resulted in improved treatment of cadmium and copper at the highest iron dose. Given the lower than expected arsenic removal observed, smaller bench-scale (Stage 3) trials were conducted using 1.5 L of synthetic ABM Lake water amended with ferric iron at both 10:1 and 20:1 iron to arsenic ratios. These trials were sampled over 7 days and showed 50% and 90% total arsenic removal for the 10:1 and 20:1 iron to arsenic ratio experiments, respectively. Improved mixing of these bench-scale trials likely explains the higher arsenic removal observed than in the pilot-scale barrel trials.

APPENDIX C. MICROBIOLOGY RESULT REPORTS (PROVIDED IN ELECTRONIC FORMAT)

GLOSSARY

ABM Lake – Lake water body that will form in the ABM open pit during mine closure when Fault Creek is returned to its original watercourse and discharges to the ABM open pit.

Acidity – A measure of the capacity of water to neutralize base. Influences pH along with alkalinity.

Acid volatile sulphide (AVS) – Sulphide complexed with Fe (FeS) where the sulphide can preferentially exchange Fe for heavy metals (Ni, Zn, Cd, Pb, Cu, Hg) which are then more stably bound.

Alkalinity – A measure of the capacity of water to neutralize acids. Influences pH along with acidity.

Amendment – A chemical or organic material added to encourage specific conditions (e.g., aerobic/anaerobic, pH, ORP) or as a source of something that is needed for passive treatment (e.g., nutrients, alkalinity, binding sites).

Authigenic precipitates – Sedimentary minerals that form during chemical precipitation or recrystallization.

Carbon source – A source of carbon (energy/electrons) for microbes (see **electron donors**). Examples include ethanol, methanol, glycerol, acetate, sugar (glucose), molasses, wood chips, detritus (dead plant matter).

Chalcophile element – Elements that have a tendency to bond with sulphur resulting in the formation of insoluble sulphide minerals.

Chemical species – Refers to the oxidation state of a chemical (e.g., selenate and selenite are species of selenium).

Constituent of potential interest (COP) – Specific elements that have been identified for evaluation. For ABM Lake, these comprise antimony, arsenic, cadmium, copper, lead, selenium, uranium, and zinc.

Dissolved organic carbon (DOC) – Organic (carbon based) molecules in water, that have passed through a filter of 0.45 µm.

Dissolved oxygen (DO) – Diatomic oxygen (O₂) dissolved in water; oxygen can dissolve in water by diffusion from surrounding air, as a product of photosynthesis, or through forced aeration.

DNA – DNA or deoxyribonucleic acid, is a self-replicating material which is present in nearly all living organisms as the main constituent of chromosomes. It is the carrier of genetic information.

Electron donor(s) – A chemical compound that donates electrons to another compound (see **carbon source**). An electron donor is a reducing agent, which that by virtue of it donating electrons, is itself oxidized (see **oxidation** and **reduction**).

Explanatory parameters – Quantifiable parameters that assist in describing how water treatment reactions take place.

Genetic analysis – Analysis to assess the presence, identity, and diversity of different microbes in a sample.

Microbes – Microscopic organisms that can be uni- or multi-cellular. This includes algae, bacteria, fungi, viruses, and yeast.

Oxidation – The loss of electrons, or increase in valence state, by a molecule, atom, or ion. Can be driven by microbes. Process is complementary to chemical reduction.

Oxidation-reduction potential (ORP) – A measure of the tendency of a chemical species to acquire or donate electrons, thus becoming reduced or oxidized, respectively, measured in millivolts.

PCR – Polymerase chain reaction, or PCR, is a laboratory technique used to make multiple copies of a segment of DNA. PCR is very precise and can be used to amplify, or copy, a specific DNA target from a mixture of DNA molecules.

qPCR – qPCR stands for quantitative polymerase chain reaction and is a technology used for measuring DNA quantity using PCR.

Redox ladder - Typical reduction order based on chemical species and redox potential (Eh) in millivolts at pH 7.

Reduction (chemical) – The gain of electrons, or a decrease in valence state, by a molecule, atom, or ion. Can be catalyzed by microbes. Process is complementary to chemical oxidation.

Selenium reduction – Microbially mediated reduction of soluble Se(VI) and Se(IV) to insoluble elemental selenium.

Simultaneously extracted metals (SEM) – amounts of heavy metals such as nickel, zinc, cadmium lead, copper, and mercury in sediment, assessed in the context of AVS for excess sulphide (also see **acid volatile sulphide**).

Sorption – The physical and/or chemical process by which one substance becomes attached to another substance.

Specific conductivity (SPC) – A measurement of electrical conductivity in water that is typically expressed in $\mu\text{S}/\text{cm}$, which has been adjusted for temperature (25°C).

Sulphide – An inorganic anion of sulphur that can form stable complexes with metals and make them insoluble in water (remove them from the water).

Sulphide producing bacteria (SPB) – Bacteria that reduce sulphur compounds, such as sulphate, sulphite, thiosulphate, and sulphur, to produce sulphides and alkalinity.

Sulphide production – The reduction of sulphur compounds, such as sulphate, sulphite, sulphur and thiosulphate, to produce sulphides and alkalinity.

Terminal electron acceptor (TEA) – The final chemical species which receives an electron in an electron transport chain during oxidation of carbon.

Tessier sequential extraction – Procedure based on Tessier et al. (1979) which determines the form and stability of metals in the substrate through a series of chemical extractions.

Transfer – Processes that treat water by transferring a constituent to another location without changing its form. For example: absorption, adsorption, dilution, dispersion, filtration, precipitation (aqueous to solid), and volatilization.

Transform – Processes that change the chemical form or state of a constituent. For example: biodegradation, biotransformation, hydrolysis, ionization, oxidation, photolysis, and reduction.

Treatment process – The method by which a constituent is treated (Rodgers and Castle, 2008).

1. INTRODUCTION

BMC Minerals (No.1) Ltd. (BMC) is proposing to develop the Kudz Ze Kayah Mine Project (the Project) in southeast Yukon, Canada. The Project is located in the Kaska Traditional Territory. The Reclamation and Closure Plan (RCP) proposed for the Project has been developed with the following main goal: *“To return the mine site and affected areas to viable and, wherever practicable, self-sustaining ecosystems that are compatible with a healthy environment and with traditional land use activities”*. The RCP illustrates the process by which closure measures have been designed to meet this goal and presents a framework for how attainment of the goal will be evaluated through post-closure monitoring programs.

The RCP includes removing the Fault Creek diversion following the cessation of mining. This will allow Fault Creek to return to its pre-mining channel and begin filling the ABM open pit, in due course creating the ABM Lake. The filling of ABM Lake is estimated to take approximately 15 years after which time it will overtop and discharge to Geona Creek. Water quality objectives (WQOs) have been proposed for the Project at receiving environment stations located on Geona Creek, South Creek, and Finlayson Creek (AEG and Minnow, 2020). WQOs are not proposed for ABM Lake, therefore the WQOs proposed for the closest receiving environment station (KZ-37) downstream of ABM Lake were used to identify elevated COPI concentrations anticipated in ABM Lake (AEG, 2018). Water quality modelling of the ABM Lake chemistry suggests that concentrations of antimony, arsenic, cadmium, copper, lead, selenium, uranium, and zinc will, without treatment, be present at levels that exceed WQOs in Geona Creek and will therefore require treatment prior to discharge (AEG, 2018). Therefore, the RCP includes *in situ* treatment of the ABM Lake water as it fills with the aim of lowering these trace element concentrations to meet required downstream WQOs.

To demonstrate the potential for successful implementation at the Project, this proposed treatment required refinement and additional proof-of-concept testing using local materials (e.g., ABM waste rock, local soil) and representative water chemistry to refine the treatment application methods, materials, and dosage quantities. To accomplish this, Ensero Solutions (formerly Alexco Environmental Group [AEG]) was retained to conduct tests aimed at further supporting the site-specific application of *in situ* lake water treatment. This report summarizes the results of bench- and pilot-scale testing for the ABM Lake *in situ* trials undertaken off-site, including:

- Research objectives (Chapter 2);
- Background, including treatment objectives, processes, and mechanisms (Chapter 3);
- Methods, including Project site material acquisition, trial design, synthetic water chemistry, trial setup, and sampling (Chapter 4);
- Treatment of constituents of potential interest (COPIs), including water quality results, scanning electron microscopy (SEM) and formation of acid volatile sulphides (AVS), COPI mineral forms and stability, and microbiology communities in the trials (Chapter 5);
- Summary of key findings (Chapter 6); and
- Conceptual implementation of *in situ* water treatment in ABM Lake (Chapter 7).

2. OBJECTIVES

The overall objectives of the off-site bench-scale and pilot-scale testing are to:

- Confirm *in situ* treatment is capable of lowering COPI concentrations in simulated ABM lake water; and
- Support predictions of the ABM Lake *in situ* treatment proposed for the Project upon cessation of mining.

3. BACKGROUND

3.1 *IN SITU* PIT LAKE TREATMENT

The Yukon Government states that “*reliance on long term active treatment is not considered acceptable for reclamation and closure planning*” (Yukon Energy, Mines and Resources, 2006). BMC recognizes that reliance on long-term “active treatment” is not acceptable; therefore, the Project is designed for a long-term closure scenario of minimal monitoring and maintenance.

The proposed *in situ* treatment involves injection of a calculated amount of soluble organic carbon (e.g., glycerol) into ABM Lake, which stimulates indigenous bacteria to produce sulphate-reducing conditions in the water column (Section 3.4). The dissolved sulphide produced under such conditions will react with chalcophile metals (elements with an affinity for forming sulphide minerals) in solution, such as antimony, cadmium, copper, lead and zinc, to form insoluble sulphide mineral precipitates (Section 3.4.4). The reducing conditions in the water column will also promote the reductive precipitation of selenium and uranium (e.g., as elemental selenium and uraninite (UO₂), respectively; Sections 3.4.2 and 3.4.3). Reducing conditions within the lake are expected to last a period of months which will allow for sufficient time for the precipitates that form to settle out of the water column.

The use of soluble organic carbon injections to significantly lower contaminant concentrations in pit lakes, underground mine workings, and shallow groundwater has been described in detail in numerous studies at locations across North America (e.g., Addison et al., 2005; Harrington, 2002; Harrington et al., 1999, 2004, 2009, 2015; Houston et al., 2005; ITRC, 2010; Lindsay, 2009; Morie et al., 2004; Murphy et al., 2008; Paulson et al., 2004; Saunders et al., 2004), including northern Canada (Gault et al., 2018). In particular, *in situ* treatment has been successfully implemented at numerous flooded open pits (Harrington, 2002; Harrington et al., 2004, 2009; ITRC, 2010; Paulson et al., 2004). *In situ* treatment uses a flooded open pit (or a portion thereof) as the reaction vessel for biologically reductive processes, treating water directly at the source. *In situ* treatment is performed through injection or placement of reagents into a flooded pit (e.g., organic carbon and nutrients) along with pumping aimed at circulating reagents throughout the desired water volume. This results in the formation of a reductive zone within a flooded pit, creating the conditions necessary for microbially mediated treatment of dissolved chalcophile metals which then form particulates that settle to the base of the pit and become buried over time as sediment naturally accumulates. The stability of these particulates becomes enhanced by burial and co-deposition of bulk iron sulphide phases in the sediment.

In situ treatment systems require relatively minimal construction and have low capital and operational costs. Treatment occurs quickly (within months) and is suitable for batch or periodic treatment of large volumes of mine-impacted water with high concentrations of metals. Treatment effects continue year-round and associated maintenance is minimal; however, periodic addition of reagents (e.g., glycerol, molasses) is sometimes needed to sustain treatment.

By treating water at the source within a flooded pit, COPs are retained in the pit lake sediment rather than being exposed to the surface environment. *In situ* treatment also provides an ancillary benefit of improving groundwater and seepage chemistry in the receiving environment should the flooded pit be a major source of such loading. Pit walls or waste materials placed in the pit can be stabilized by the creation of saturated biochemically reducing conditions where oxidative leaching is avoided or minimized.

The following case studies provide examples of *in situ* treatment implementation similar to the proposed ABM Lake water treatment.

3.1.1 CASE STUDY #1 SWEETWATER PIT LAKE (WYOMING, USA)

In situ treatment was employed to treat elevated selenium and uranium concentrations in the circumneutral pH pit lake at the Sweetwater uranium mine (Wyoming, USA). Addition of soluble organic carbon resulted in the decrease of nitrate-N concentrations from 1.1 mg/L to below detection within the first two weeks of treatment (Harrington, 2002). Within four months, uranium and selenium concentrations decreased from 8.1 to approximately 4.2 mg/L (target 5.0 mg/L) and 0.46 to approximately 0.004 mg/L (target 0.05 mg/L), respectively. The post-treatment concentrations remained at those levels for four years following *in situ* treatment (Paulson et al., 2004), with follow up sampling indicating that such levels have continued to be maintained beyond ten years of monitoring.

3.1.2 CASE STUDY #2 BARITE HILL PIT LAKE (SOUTH CAROLINA, USA)

The pit lake at the Barite Hill gold mine (South Carolina, USA) was the subject of *in situ* treatment using a phased chemical and microbiological treatment. Prior to treatment, this pit lake was acidic (pH 1.5 to 2) and had high trace element concentrations (Table 3-1). Carbide lime was used to raise the pit lake pH closer to circumneutral conditions, while injection of soluble organic carbon created sulphate-reducing conditions that sequestered the metals as metal sulphides and/or as less soluble reduced phases. Comparison of constituent concentrations before and after *in situ* treatment indicated greater than 70% removal of antimony from the pit lake water column and greater than 90% removal of other metal(loid)s of concern (Table 3-1; Harrington et al., 2009).

Table 3-1: Barite Hill Pit Lake Constituent Concentrations Before and After *In Situ* Treatment (Harrington et al., 2009)

Parameter	Concentration Before <i>In Situ</i> Treatment	Concentration After <i>In Situ</i> Treatment	Percent Reduction
	mg/L	mg/L	%
Antimony	0.02	<0.006	>70
Arsenic	0.968	<0.01	>99
Cadmium	1.57	<0.005	>99
Chromium	0.141	<0.01	>92
Copper	287	<0.01	>99
Lead	0.161	<0.01	>93
Nickel	0.404	<0.02	>95
Selenium	0.23	0.01	96
Zinc	40.2	<0.02	>99

3.1.3 CASE STUDY #3 ANCHOR HILL PIT LAKE (SOUTH DAKOTA, USA)

The Anchor Hill pit lake at the Gilt Edge Mine Superfund Site (South Dakota, USA) was also subject of *in situ* treatment resulting in significantly lower elevated metal(loid) and nitrate concentrations prior to a batch discharge of treated water. The acidic pit (pH 3) was treated with lime and sodium hydroxide to initially raise the pH before methanol and molasses were added to stimulate the development of sulphate-reducing conditions in the water column and associated metals removal. This resulted in near complete nitrate removal (from 55 to 0.01 mg/L) and reductions in pit lake trace element concentrations of between 86% and greater than 99% (Table 3-2; Harrington et al., 2004).

Table 3-2: Anchor Hill Pit Lake Constituent Concentrations Before and After *In Situ* Treatment (Harrington et al., 2004).

Parameter	Concentration Before <i>In Situ</i> Treatment	Concentration After <i>In Situ</i> Treatment	Percent Reduction
	mg/L	mg/L	%
Nitrate-N	55	0.013	>99
Arsenic	0.017	Below detection ¹	-
Cadmium	0.284	0.007	98
Copper	13.6	0.028	>99
Lead	0.0281	Below detection ¹	-
Nickel	0.348	0.048	86
Selenium	0.0222	<0.0009	>96
Zinc	6.66	0.15	98

¹ Detection limit not reported.

3.1.4 TECHNOLOGY SUITABILITY FOR COLD CLIMATE

Longer-term data are available for organic carbon injections to pit lakes, where resultant water treatment has extended over winter (e.g., Sweetwater and Barite Hill pit lakes; Harrington et al., 2009; Park et al., 2009; Paulson et al., 2004), and in some instances for many years after the last carbon injection event (e.g., Sweetwater pit lake; Paulson et al., 2004). It is important to note that both the Anchor Hill and Sweetwater pit lake locations experience cold winters, with the Sweetwater pit lake frozen/ice covered from early December until March. The pit lakes both freeze over during winter, but this has not impeded the constituent removal obtained by *in situ* treatment. Indeed, the ice cover may be beneficial in that it acts as a barrier to the mixing and diffusion of oxygen from the atmosphere into the lake. In this context, carbon additions at both Anchor Hill and Sweetwater pit lakes were typically performed in the late summer or fall to prolong the period that the lake would remain reducing and therefore maximize constituent removal. Furthermore, Ensero personnel have directed the carbon injection *in situ* treatment of the flooded mine workings at the Silver King mine (Keno Hill, central Yukon) since 2015. The water temperature in this mine typically varies between 2°C and 5°C year-round and has demonstrated prolonged constituent removal (cadmium and zinc; greater than or equal to 75% removal over two year period since commissioning of *in situ* treatment; Gault et al., 2018). This indicates that treatment of cold waters is feasible using this technology.

3.2 TREATMENT OBJECTIVES

In situ pit lake treatment is a water treatment system specifically designed to treat certain COPIs that may be present in impacted waters. The following summarizes the Project specific COPIs and their associated WQOs.

COPIs for the Project were identified as those constituents with baseline concentrations in surface water that exceeded WQOs, or those predicted to exceed the WQOs, during the Project phases in the absence of appropriate mitigation measures (AEG and Minnow, 2020). Twenty COPIs have been identified for the Project, which include aluminum, unionized ammonia, antimony, arsenic, cadmium, cobalt, copper, weak acid dissociable cyanide, fluoride, iron, lead, manganese, nickel, nitrate, nitrite, selenium, sulphate, thallium, uranium, and zinc (AEG and Minnow, 2020). Although WQOs are not proposed for ABM Lake itself, the WQOs proposed for the closest receiving environment station (KZ-37) downstream of ABM Lake were used to screen the concentrations anticipated in ABM Lake in the absence of *in situ* treatment (AEG, 2018). Based on water quality modelling, eight COPIs are predicted to exceed the Project KZ-37 WQOs (AEG, 2018). The eight COPIs that were the focus of *in situ* treatment trials discussed in this report include total arsenic, antimony, lead, selenium, and uranium, and dissolved cadmium, copper, and zinc (the assignment of total and dissolved refers to the fraction for which a WQO was developed; AEG and Minnow, 2020). The applicable WQOs are summarized in Table 3-3 alongside the assumed COPI removal inputs to the water quality model for *in situ* treatment (AEG, 2018). The COPI concentrations used in the model for ABM Lake after the implementation of *in situ* treatment are also presented in Table 3-3; these are referred to as the “treatment targets” in this report and are used as a comparator for the trial data. While these eight COPIs comprise the focus of this report, data are available for all twenty Project COPIs, except for cyanide and fluoride which were not evaluated as part of the *in situ* treatment trials. Cyanide is a product of ore processing during mining operations and is therefore not anticipated to be present in ABM Lake. Fluoride is naturally elevated in surface waters at the Project site (AEG, 2019a), but is expected to be present in ABM Lake at levels well below the WQO (AEG, 2018; AEG and Minnow, 2020).

Table 3-3: Estimated Concentrations of Constituents of Potential Interest in ABM Lake upon Full Flooding, Predicted Percent Removal, and WQOs

COPI	Units	ABM Lake Concentration ¹			Water Quality Objective at Station KZ-37

² These “treatment targets” are presented for comparison with the trial results in Section 5

3.3 TREATMENT PROCESS

The pilot-scale *in situ* treatment test work outlined herein has been designed to treat COPIs that are insoluble under sulphate-reducing conditions, specifically antimony, cadmium, copper, lead, selenium, uranium, and zinc. Arsenic treatment is specifically discussed in Section 3.4.5. The *in situ* treatment is designed to stimulate microbes in the system that naturally occur in/on the water, rock, and soil in the system through addition of organic carbon. The microbes oxidize the reduced carbon “food” source (e.g., ethanol, glycerol) and transfer the electrons released to a terminal electron acceptor (TEA). The TEAs are generally used in the order most energetically favorable (i.e., most energy generated) by microbes. Of the major TEAs typically present in mine-impacted surface waters and soils/sediments, dissolved oxygen (DO) is utilised first followed by nitrate (NO_3), then selenate (Se(VI)), manganate (Mn(IV)), ferric iron (Fe(III)), uranyl (U(VI)), and sulphate (SO_4) (Borch et al., 2010), creating a “redox (reduction-oxidation) ladder” (Figure 3-1). The order of TEA utilization can also be influenced by pH and TEA concentration.

Figure 3-1: Redox Potential and Terminal Electron Acceptors

Summarized based on theoretical redox ladder (Borch et al., 2010)

TEAs are monitored through the *in situ* pilot-scale trials in order to evaluate conditions that are established in the systems. The theoretical order of TEA consumption is not absolute, but it is a useful to guide treatment design and performance evaluation. The *in situ* pilot-scale trials have been designed to target sulphate-reducing conditions, to remove TEAs above sulphate in the redox ladder (e.g., nitrate, selenium, uranium; Figure 3-1), and to promote the formation of sulphide which then reacts with chalcophile metals to form insoluble sulphide minerals. These insoluble sulphide minerals precipitate from the water column and settle to the bottom of the treatment system (i.e., barrel or pit lake).

Parameters such as dissolved iron and dissolved manganese can provide insight into the conditions in the pit lake trials, with increased concentrations of these parameters showing targeted reducing conditions have been achieved based on the theoretical redox ladder (Borch et al., 2010). TEA consumption can be influenced by numerous factors including the overall concentrations of reduced and oxidized TEA species, spatial distribution of organic electron donors and TEAs, and the abundance and diversity of TEA-metabolizing microbial populations. The specific mechanisms for treatment of the COPIs are described in Section 3.4.

3.4 TREATMENT MECHANISMS

3.4.1 DENITRIFYING BACTERIA

Nitrate is typically more desired as an electron acceptor by microbes over selenium and sulphate, so microbes therefore tend to preferentially reduce nitrate (Borch et al., 2010; Tan et al., 2016). Nitrate and nitrite can be removed from water through the denitrification activity of different types of microbes, including nitrate-reducing bacteria which can reduce nitrate (NO_3) to nitrite (NO_2), and other denitrifying organisms that are capable of fully reducing nitrate to nitric oxide (NO), nitrous oxide (N_2O), and subsequently to dinitrogen gas (N_2 , which is the most abundant gas in air).

3.4.2 SELENIUM-REDUCING BACTERIA

The targeted selenium treatment pathway is the reduction of selenate (Se(VI)) and selenite (Se(IV)) to insoluble elemental selenium (Se(0)). There are several different types of selenate- and selenite-reducing bacteria that can reduce these soluble forms of selenium to insoluble elemental selenium (e.g., Gonzalez-Gil et al., 2016; Nancharaiyah and Lens, 2015; Sharma et al., 2015).

3.4.3 URANIUM-REDUCING BACTERIA

Under uranium-reducing conditions, uranium is removed from solution through microbially mediated reduction of soluble uranyl (U(VI)) to uranium in its +4 oxidation state (U(IV)) by uranium-reducing bacteria (URB), followed by precipitation of U(IV) as uraninite (UO_2) (Lovley et al., 1991; Shelobolina et al., 2007). Uranyl is reduced under similar conditions as sulphate (anaerobic/reducing); there is overlap between the types of organisms that can produce sulphides and those that are able to remove uranium through reductive processes.

3.4.4 SULPHIDE-PRODUCING BACTERIA

Sulphate-reducing conditions are encountered when the above processes have advanced such that the TEAs higher than sulphate on the redox ladder have either been consumed or are less energetically favourable to reduce than sulphate (e.g., when the products of TEA reduction make further reduction of that TEA energetically unfavourable). Under such conditions, sulphate is reduced by bacteria to form sulphide, which may then react with chalcophile COPs to form insoluble sulphide minerals. The insoluble sulphide minerals then precipitate from the water column as authigenic precipitates prior to settling on the ABM Lake bottom. Sulphide production is carried out by sulphide-producing bacteria (SPB) through the reduction of sulphur-containing compounds.

3.4.5 ARSENIC REMOVAL

Arsenic mobility is linked to iron and sulphur cycling at redox boundaries, as well as associated co-precipitation reactions of iron (oxyhydr)oxides, iron monosulphides, and pyrite (Edenborn et al., 1986; Moore et al., 1988). Under reducing conditions, arsenic may be immobilized through formation of insoluble sulphide minerals including arsenic sulphides, and substitution within a variety of metal sulphides, and can exist as sorption complexes on these sulphides (Sun et al., 2016). Conversely, under oxidizing conditions, arsenic adsorbs on, and co-precipitates with iron (oxyhydr)oxides (O'Day, 2006). Stoichiometrically, there are chemical processes that suggest a one to one (1:1) molar ratio of iron to arsenic is needed to bind arsenic and render it insoluble. However, in application, an excess of iron is needed to facilitate arsenic treatment. The United States Environmental Protection Agency (USEPA) recommend an

iron to arsenic ratio of 20:1 (by mass) to facilitate arsenic treatment via adsorption on and co-precipitation with iron hydroxide (USEPA, 2005).

4. METHODS FOR *IN SITU* PILOT- AND BENCH-SCALE TRIALS

4.1 PILOT-SCALE TRIAL DESIGN

Pilot-scale testing was conducted at Ensero's laboratory in Saskatoon. The test systems consisted of eight 200 L plastic barrels each containing 10 kg of composite waste rock (Section 4.1.1) and filled with synthetic ABM Lake water (described in Section 4.2). Trials differed in the amount of soil amendment added (10 g versus 10 kg; described in Section 4.1.1), COPI concentrations (water quality model versus ten times the water quality model; described in Section 4.2), carbon dosing (regular versus high; described in Section 4.1.3), and temperature (room temperature versus 5°C; described in Section 4.1.4). A summary of the trials is detailed in Table 4-1. Trials 7 and 8 were held as controls, with no carbon or nutrients added to those trials as described in Section 4.1.3.

Additional arsenic (0.03 mg/L) was added to the trials with 10 kg of soil (Trials 3, 4 and 8) to compensate for the relatively low arsenic content of the soil compared to the overburden collected elsewhere in the ABM open pit footprint (AEG, 2019b; described in Section 5.5). Trial 6 had ten times the metals concentrations of the predicted water quality model to determine the maximum treatment possible (described in Section 4.2). These additions are detailed further below.

Table 4-1: Summary of Trial Setup

Trial #	Amount of Soil Added (kg)	Carbon Dosage	Temperature (°C)	COPI Concentration Reference ¹
1	0.01	Regular	22	Water Quality Model
2	0.01	High	22	Water Quality Model
3	10	Regular	22	Water Quality Model + Arsenic
4	10	High	22	Water Quality Model + Arsenic
5	0.01	High	5	Water Quality Model
6	0.01	Regular	22	10x Water Quality Model
7	0.01	None	22	Water Quality Model
8	10	None	22	Water Quality Model + Arsenic

¹ Water quality model reported in AEG, 2018. Arsenic addition and 10x water quality model as described in Sections 4.1.1 and 4.1.3, respectively.

4.1.1 PROJECT SITE MATERIAL ACQUISITION

Materials required to construct the pilot-scale trials include soil local to the proposed ABM open pit location (soil amendment), local waste rock extracted from the ABM open pit footprint, and 200 L plastic barrels with sealable lids. The soil amendment was collected by AEG on September 27, 2018 from the southern end of the ABM open pit area (Photo 4-1). Waste rock was selected by BMC geologists from their on site drill core collection and also from the existing inventory held at Global ARD Testing Services Inc. (Global ARD) in Burnaby, British Columbia (BC) to simulate the exposed ABM open pit walls. The drill core selection encompassed samples from the ore zone, alteration halo, other potentially acid-generating (PAG) material, and non-PAG material in the approximate proportions they are likely to be exposed in the final pit wall. Each of these rock categories were crushed to particles passing two inches at the University of British Columbia (UBC) and homogenized. Portions from each rock category were then mixed and homogenized by Global ARD into individual 10 kg composites reflective of the final pit wall rock composition (Photo 4-1) under the direction of BMC.

Photograph 4-1: Project Site Materials

Local Soil (Left) and Rock Composites (Right)

4.1.2 SOIL AMENDMENT

Trials 1, 2, and 5 to 7 (control) received 10 g of soil amendment to provide a source of local microbes. Trials 3, 4, and 8 (control) received a larger soil amendment (10 kg) to examine the option of supplementing the ABM Lake with local overburden during the early years of its formation. This larger soil addition is expected to provide a source of reducible iron to the system that may assist in metals removal and extend treatment longevity by creating a pool of labile iron sulphide that acts as a redox buffer to the ingress of Fault Creek water, which would be in an oxidizing condition. The soil material utilised in the trials was sourced from a waterlogged area of the Kudz Ze Kayah site, located close to where Fault Creek will discharge to the ABM pit at closure (GPS coordinates 61.459375N, 130.595483W). A shallow 1 m² pit was dug by hand and soil from the top 15 cm was collected in 20 L pails. The soil in each pail was stirred thoroughly prior to collecting a subsample for amendment in the trials.

During *in situ* treatment, transient iron-reducing conditions are expected to form. Under such conditions, poorly crystalline iron (oxyhydr)oxides can undergo reductive dissolution and release adsorbed constituents. Arsenic is commonly associated with iron (oxyhydr)oxides and can be mobilized under iron-reducing conditions. The arsenic content of the soil used to amend the *in situ* trials (4.3 mg/kg) was lower than the average arsenic content of overburden samples collected from the ABM open pit footprint (16.5 mg/kg; AEG, 2019b). Therefore, it was likely that any arsenic release under iron-reducing conditions from the soil added to the trials may be underestimated. To compensate for this, approximately 50% more arsenic (equivalent to an additional 0.03 mg/L) was added to those trials with 10 kg soil added (Trials 3, 4, and 8). This assumed that 20% of the bulk soil arsenic was associated with the iron (oxyhydr)oxide fraction of which only 25% was accessible. No additional arsenic was added to the other experiments, as the 10 g mass of soil would be a negligible contributor of arsenic.

4.1.3 CARBON AND NUTRIENT AMENDMENTS

An organic carbon amendment was added to Trials 1 through 6 in the form of 100% glycerol as the method of treatment. Glycerol was preferred to alcohol since it represents an electron-dense organic electron donor that does not have the flammability issues associated with other volatile alcohols, and therefore is more amenable to large scale industrial uses. Glycerol was dosed at the start of each trial at “regular” and “high” levels with dosages outlined in Table 4-2. The regular carbon dosage was calculated based on:

- Stoichiometric reduction of the main TEAs (Figure 3-1) in the water column measured in samples collected from each trial;
- Reduction of 10% of the soil reducible iron fraction (determined via Tessier et al. (1979) extraction) for Trials 3 and 4 that received a 10 kg soil amendment; and
- Reduction of enough sulphate to provide sulphide for precipitation of chalcophile COPs with some residual sulphide to provide buffering against the ingress of oxygen.

Calculation of the “high” carbon dose included the same considerations as the “regular” dose, but additional carbon was added to create additional sulphide. Trials 7 and 8 received no organic carbon addition to act as controls against the carbon amended experiments. Additional glycerol was added to Trials 1 through 6 at Week 11 (Table 4-2), due to an increase in oxidation-reduction potential (ORP), DO, and nitrate concentrations, indicative of oxidizing conditions (see Section 5.1.1 for details).

Molasses was also added to Trials 1 through 6 at the start of the trials at a dose of 10 mg/L carbon to simulate carbon that would be naturally occurring in the ABM Lake via fallen leaves and soil accumulation, for example, during the lake filling process. Nitrogen and phosphorus were also added to Trials 1 through 6 at the start of the trials as nutrients for growth in the form of ammonium sulphate and monopotassium phosphate (MKP), respectively, following a 50:14:3 (carbon: nitrogen: phosphorus (C:N:P)) molar ratio based on the molasses addition (Harrington, et. al., 2018).

Table 4-2: Initial and Top-up Glycerol Dosages in Trials 1 Through 8

Trial	Carbon Dosage	100% Glycerol Dosage (mL)	
		Initial	Top-up (Week 11)
Trial 1	Regular	2.10	2.03
Trial 2	High	5.94	9.74
Trial 3	Regular	3.02	4.06
Trial 4	High	7.32	12.17
Trial 5	High	6.50	9.74
Trial 6	Regular	3.28	4.46
Trial 7	—	0	0
Trial 8	—	0	0

— No carbon was added.

4.1.4 TEMPERATURE

Seven of the eight trials were conducted at room temperature (approximately 22°C). However, ABM Lake water will likely be lower temperature than this (approximately 5°C to 10°C) during the late summer/fall when carbon injection would likely be conducted. Therefore, one of the trials (Trial 5) was conducted at 5°C in a walk-in cooler. Trial 5 was also dosed at a “high” carbon dosage as cold temperatures are known to slow microbial activity (e.g., Marais et al., 2018), and therefore higher carbon doses may be required to compensate for the cold temperatures and to effectively facilitate *in situ* treatment.

4.2 SYNTHETIC WATER CHEMISTRY

A water chemistry recipe (Table 4-3) was developed to mimic the ABM Lake water quality that is anticipated upon filling of the ABM open pit based on the water quality model (AEG, 2018). To generate the synthetic water recipe, metal salts were added to the City of Saskatoon municipal tap water to achieve the targeted concentration of each parameter outlined in Table 4-3. Tap water was utilised since it is a cost-effective supply of the large volumes of water required (versus deionized water) and similar biological treatment studies conducted by Ensero using tap water have not observed any detrimental effect on microbial activity. Several parameters (e.g., aluminum, iron) were not predicted to be higher than the concentrations already present in the tap water, and hence were not added. Calcium concentrations in the influent trials were lower than targeted concentrations due to the solubility limit of the calcium sulphate compound. The amount of calcium added to the influent was therefore decreased to 85% of the target concentration. Sulphate concentrations in the synthetic influent were largely brought to target indirectly, through the addition of calcium sulphate. No pH amendment was required since the solution pH (7.0 to 7.4) was comparable to that expected in ABM Lake (pH 7.0 to 8.0).

Trial 6 had ten times the metals concentrations of the predicted water quality model (AEG, 2018) to determine the maximum treatment possible, with the targeted concentration outlined in Table 4-3. The 10 g soil and 10 kg soil trials had the same target parameter concentrations, with the exception of additional arsenic that was added to the 10 kg soil trials as described in Section 5.5.

Table 4-3: Target Total Concentrations for Synthetic ABM Lake Water When Fully Flooded (AEG, 2018)

Parameter	Compound added to water	Target synthetic water concentration (mg/L)		
		10 g soil trials	10 kg soil trials	10X metals salts trial
Aluminum ¹	-	0.01	0.01	0.01
Antimony	KSb(OH) ₆	0.019	0.019	0.190
Arsenic	Na ₂ HAsO ₄ •7H ₂ O	0.058	0.088	0.580
Cadmium	CdCl ₂	0.004	0.004	0.040
Calcium ²	CaSO ₄ •2H ₂ O	101.15	101.15	101.15
Cobalt	CoSO ₄ •7H ₂ O	0.0026	0.0026	0.0260
Copper	CuSO ₄ •5H ₂ O	0.019	0.019	0.190
Iron ¹	-	0.01	0.01	0.01
Lead	Pb(NO ₃) ₂	0.029	0.029	0.290
Manganese ¹	-	0.01	0.01	0.01
Nickel	NiCl ₂ •6H ₂ O	0.01	0.01	0.10
Selenium	Na ₂ SeO ₄	0.0096	0.0096	0.0960
Sulphate ³	-	231	231	231
Thallium	Tl ₂ SO ₄	0.00018	0.00018	0.00180
Uranium	Uranium Standard	0.034	0.034	0.340
Zinc	ZnSO ₄ •7H ₂ O	0.38	0.38	3.80

¹ Not added to the synthetic influent, as background concentrations in tap water were greater than target.

² Calcium target concentration is 85% of water quality model (AEG 2018) due to maximum solubility of the compound used.

³ A large percentage of the sulphate concentrations come from calcium sulphate addition, and in tap water.

4.3 TRIAL SETUP

Each of the trials received 10 kg of the crushed waste rock composite, followed by the soil amendment in quantities outlined in Table 4-1. Each barrel was then filled with tap water and left to equilibrate for 48 hours, after which a water sample was collected and sent to Bureau Veritas Laboratories (BVL, formerly known as Maxxam Analytics) for total and dissolved metals analysis (as described in Section 4.5.1, sampling methods). Initial metal concentrations provided a baseline for further metals addition (as salts) to each barrel to achieve the targeted water concentrations as outlined in Table 4-3. Following the metal salt addition, the trials were again allowed to equilibrate for 48 hours before sampling for total and dissolved metals and anions to confirm that the target concentrations were met in a range of plus or minus 20%.

Barrels remained sealed with a lid and metal ring for the duration of the trials. To keep the trials as free from oxygen as possible, sampling was performed through a bung cap in the lid. After the target constituent concentrations were achieved in each trial, 100% glycerol was added in the dosages as provided in Table 4-2. Additional molasses, nitrogen and phosphorus were added to Trials 1 through 6 at the start of the trials as described in Section 4.1.3. Dosing of glycerol in Stage 1 and 2, was performed by adding glycerol to a conical centrifuge tube and adding to the trials by slow stirring with a large spoon to ensure that minimal disturbance was created.

4.4 PILOT TRIALS TESTING PERIODS

Pilot-scale testing was initiated on March 25, 2019, based on the addition of carbon. *In situ* pilot-scale testing was conducted in two stages (Stage 1 and Stage 2), which was followed by a bench-scale trial (Stage 3) (Figure 4-1). Stage 1 of the *in situ* pilot-scale tests informed on the degree of constituent removal following organic carbon addition, and the effect of excess soil amendment (Section 5.1). Stage 2 of the *in situ* pilot-scale tests informed on the degree of arsenic removal through the addition of ferric iron either before or after glycerol addition (i.e., under oxidizing or reducing conditions, respectively) (Section 5.2). The Stage 3 bench-scale experiment was performed to validate arsenic removal in the presence of iron amendment when adequate mixing was attained (Section 5.2).

Figure 4-1: Testing Schedule Trials

4.4.1 SUMMARY OF KEY EVENTS DURING TRIALS

A summary of key events during Stage 1 and Stage 2 of the *in situ* pilot-scale treatment trials are detailed in Table 4-4 and Table 4-5, respectively. Details on sampling events can be found in Section 4.5.

Table 4-4: Summary of Key Events During Stage 1 of Pilot-scale Trial

Date	Week	Timeline
January 30, 2019	N/A	Initial microbiology sampling of soil amendment, waste rock, and water used in trials.
January 30, 2019	N/A	Trial set-up and synthetic water development.
March 25, 2019	0	Carbon, nitrogen and phosphorus added to trials. ¹ First routine water sampling and start of sampling frequency of every two weeks.
June 14, 2019	11	Carbon top-up in form of glycerol.
September 9, 2019	22	Microbiology monitoring of water from Trials 2-5. Routine water sampling frequency moved to monthly.
December 2, 2019	34	Final routine water sampling event for all trials.
December 4, 2019	34	Final microbiology and soil sampling during take down of Trials 3, 4, & 8.

¹ Carbon added in the form of glycerol and molasses. Nitrogen and phosphorus were also added as nutrients for microbial growth.

Table 4-5: Summary of Key Events During Stage 2 of Pilot-scale Trial

Date	Week	Timeline
January 2, 2020	0	Addition of iron to Trials 1 & 5. Addition of glycerol to Trial 2 (13.0 mL) & Trial 6 (12.9 mL).
January 8, 2020	1	First routine water sampling event for Trials 1 & 5.
January 15, 2020	2	Sampled all trials, first routine water sampling event for Trials 2 & 6.

February 26, 2020	8	Water sampling event for Trials 1 & 5.
March 11, 2020	10	Water sampling event for Trials 2 & 6.
March 25, 2020	12	Final routine water sampling event for Trials 1, 2, 5 & 6. Final microbiology sampling during take down of Trials 1, 2, 5, 6 & 7.

4.4.2 STAGE 2 PILOT-SCALE TRIALS WITH IRON ADDITION

Trials 1, 2, 5, and 6 were used to investigate the addition of ferric iron to precipitate and remove arsenic under oxidizing or reducing conditions (i.e., before or after the addition of glycerol to establish of reducing conditions). Trials 1 and 2 targeted iron to arsenic mass ratios of 10:1, while Trials 5 and 6 targeted iron to arsenic ratios of 20:1 (Table 4-6). A 20:1 mass ratio of iron to arsenic was chosen based on recommendations by the USEPA (USEPA, 2005), with the lower 10:1 mass ration selected to examine the extent of arsenic treatment at a lower iron dosing ratio. Dissolved arsenic concentrations from Week 34 of Stage 1 of the trials (December 2, 2019) were used to calculate required ferric iron additions. The addition of ferric iron marked the beginning (Week 0) of Stage 2 of the pilot-scale trials. Iron (III) sulphate hydrate was dissolved into a stock solution, prior to being added to the barrels. A circulating pump was used to mix the iron (III) sulphate stock solution in the barrels for approximately five minutes. Glycerol dosing of 12.9 to 13.2 mL was performed, analogous to the “high” carbon dose employed for some trials in Stage 1 (Section 4.3). Stage 2 trials were performed for 12 weeks with details outlined in Table 4-5.

Table 4-6: Summary of Amendments and Dosing During Stage 2 of Pilot-scale Trial

Trial	Temperature (°C)	Fe:As Mass Ratio	Description	Week 34 Dissolved Arsenic Concentration (mg/L)	Ferric iron added (mg/L)
1	22	10:1	- Iron addition (Week 0) - Glycerol addition (Week 4) - Water Quality Model¹ COPI concentration	0.052	0.5
2	22	10:1	- Glycerol addition (Week 0) - Iron addition (Week 4) - Water Quality Model COPI concentration	0.049	0.5
5	5	20:1	- Iron addition (Week 0) - Glycerol addition (Week 4) - Water Quality Model COPI concentration	0.051	1
6	22	20:1	- Glycerol addition (Week 0) - Iron addition (Week 4) 10x Water Quality Model COPI concentration	0.295	6

4.5 SAMPLING

4.5.1 ROUTINE WATER QUALITY SAMPLING

Water quality sampling was conducted at the start of the trials following the glycerol addition (time = 0), every two weeks for the first 16 weeks, and every four weeks thereafter through to Week 34 of Stage 1 of the *in situ* treatment trials (Table 4-4). Water quality sampling that was performed for the 12-week Stage 2 testing period is summarized in Table 4-5. The parameters analysed during Stage 1 and 2 are presented in Table 4-7 and Table 4-8, respectively. Laboratory results are reported in Appendix A, with raw data from *in situ* trials summarized in Appendix B.

Table 4-7: Water Sampling Parameters and Frequency for Stage 1 *in situ* Treatment Trials

Test Parameters	Frequency	Sample Location	Total Number of Samples	Number of Sampling Events

¹ICP-MS: Inductively coupled plasma mass spectrometry.

Water sampling was conducted according to Ensero's sampling protocols, developed following the "*Standard methods for the examination of water and wastewater*" (Rice et al., 2012), which was co-produced by the American Public Health Association, the American Water Works Association, and the Water Environment Federations.

Routine water samples were prepared in sample bottles appropriate for each analysis parameter, as provided by BVL in Burnaby, BC. Sample collectors wore clean and new nitrile gloves when collecting samples. Bottles were capped immediately after filling. All samples were collected in labelled bottles that identified the sample location, date and time of collection, field filtering and/or preservation and analysis requested. Samples were filtered and/or preserved according to the analytical service provider's instructions (BVL).

Chain of Custody (COC) forms were completed at the time of sampling and contained all information from the sample bottles labels. COCs signed by the sampler were packed inside the coolers used to transport the samples to the laboratory. All samples were stored in coolers with freezer packs to remain cold (4°C), but not frozen, during sampling and during transport to BVL.

Water was sampled through a bung cap in the lid of the barrel in efforts to introduce the least amount of air as possible to the trials. Water was collected at approximately one-third to half-way down the water column into one

litre sampling containers using a peristaltic pump and tubing. Collected water was aliquoted into clean, laboratory prepared sample bottles appropriate for each analysis parameter. Each trial was designated its own tubing and following each sampling event the tubing was rinsed with reverse osmosis water using a clean syringe. To minimize interaction with the atmosphere the lids of the barrels were sealed using metal clamps between sampling events.

In situ water DO (mg/L), temperature (°C), pH, conductivity (micro Siemens per centimeter [$\mu\text{S}/\text{cm}$]), specific conductivity (SPC; $\mu\text{S}/\text{cm}$), and ORP (mV) were measured following the collection of routine water samples. Measurements were conducted with a YSI Professional Plus handheld unit calibrated according to the manufacturer's instructions. *In situ* parameters were measured at three different water depths (10 cm from the surface of the water, middle of the water column, and 10 cm from the top of the rock/soil layer at the bottom) through the bung cap of each barrel to examine if the water column became stratified over the course of the trials.

Water was not topped up during the trials, since a minimal volume of water was taken at each sampling event. Over the duration of the pilot-scale test work, approximately 8.75% to 12.5% (17.5 to 25 L) of the total water volume was removed for analysis.

4.5.2 SUBSTRATE SAMPLING

A sample of the site soil used to amend the trials was collected by filling and sealing glass jars while submerged under the water it was shipped in to limit oxidation. The samples were stored at 4°C for approximately 10 months during the experiments owing to the minimum sample number required by the laboratory for acid volatile sulphides (AVS) analysis; results of this storage are further described in Section 5.5.1. Samples of the soil amendment were taken anaerobically as described below from Trials 3, 4, and 8 upon take down on December 4, 2019 (Week 34 of Stage 1). The initial soil inoculum and Trials 3, 4, and 8 soil samples were submitted to BVL for acid volatile sulphides and simultaneously extracted metals (AVS: ΣSEM), and Tessier sequential extraction analysis for Trials 4 and 8 (Table 4-9). These trials were chosen for analysis based on the higher volume of soil substrate present in the trials. Soil samples from Trials 3, 4 and 8 at take-down were collected by using a pump to drain two-thirds of the water out of the barrel. AVS+SEM and Tessier samples were collected in 125 mL glass jars provided by BVL and capped under water with minimal headspace. Following United States Environmental Protection Agency method 821-R-91-100 (USEPA, 1991), the samples were then put into a glove bag under a nitrogen atmosphere to minimize oxidation of the sample. The surface of the sample was flushed to deoxygenate the overlying water and ensure any minimal headspace that remained was oxygen free (USEPA, 1991). All samples were stored in coolers with freezer packs to remain cold (4°C), but not frozen, during sampling and during transport to BVL.

Table 4-9: Soil Sampling Parameters and Frequency

Test Parameters	Frequency	Sample Location	Total Number of Samples	Number of Sampling Events
Sequential leach Tessier extraction (Al, Sb, As, Ba, Be, Bi, Cd, Ca, Cr, Co, Cu, Fe, Pb, Li, Mn, Mo, Ni, P, K, Se, Ag, Na, Sr, Tl, Sn, Ti, U, V, Zn) (mg/kg)	Prior to construction	Soil inoculum	1	1
	Week 34 of Stage 1 (4-Dec-2019)	Trial 4 & 8 substrate	2	1
AVS+ Σ SEM ¹ (μ mol/kg)	Week 34 of Stage 1 (4-Dec-2019)	Initial soil inoculum ² , Trial 3, 4 & 8 substrate	4	1

¹AVS + Σ SEM – Acid volatile sulphides and simultaneously extracted metals.

²The initial soil inoculum sample was collected from soil material during the trial set-up and had been stored for approximately 10 months during the experiments owing to the minimum sample number required by the laboratory for AVS analysis.

Mineral formation and stability of COPs were evaluated at the end of operations for Trials 4 and 8 via the Tessier sequential extraction method (Tessier et al., 1979) to aid in understanding the COP mineral formation as well as mineral association in the substrate (Table 4-10).

Table 4-10: Summary of Extractable Fractions from Tessier Sequential Extraction Procedure ¹

Fraction	Description	Stability of Metals Associated With Soil Fraction
1	Exchangeable fraction for adsorbed metals	Readily released (i.e., soluble and exchangeable)
2	Metal fraction bound to carbonates	Released under acidic pH
3	Metal fraction bound to Fe-Mn oxides	Released under reducing conditions
4	Metal fraction bound to organic matter and sulphides	Released under oxidizing conditions
5	Residual metal fraction (oxides and silicate minerals recalcitrant to dissolution at ambient conditions)	Not expected to be released in solution over time under conditions normally encountered in nature

¹ Method based on Tessier et al. (1979).

4.5.2.1 LABORATORY QUALITY CONTROL SAMPLE ANALYSIS

Laboratory analysis were performed by BVL. Overall quality control sample analysis from method blanks, laboratory duplicates, matrix spikes and blank spikes met the BVL laboratory acceptability criteria and consequently the data were issued.

4.5.3 MICROBIOLOGY SAMPLING

Microbes are the catalysts for the beneficial biogeochemical reactions occurring in the *in situ* trials (Section 3.3). Microbial testing can be used to compare microbial communities established in the water and associated with the substrate in different trial conditions, and over time. Microbial testing included genetic quantification of bacteria associated with specific sample types via quantitative polymerase chain reaction (qPCR), as well as genetic sequencing via the 16S ribosomal ribonucleic acid gene to identify the bacterial community and distribution of beneficial organisms. The microbial communities in the trials were tested with the initial materials used to construct the trials, as well as during the study to evaluate the distribution and establishment of beneficial microbes for the different trial designs (Table 4-11).

Microbiology samples were taken of water from Trials 2 to 6 on September 9, 2019 (Week 22 of Stage 1) based on the range of COPI removal observed over the first 22 weeks. Final microbiology water and substrate (i.e., mixed rock and soil) samples were collected during take down of trials (Week 34 of Stage 1) on December 4, 2019 for Trials 3, 4, and 8, and after the Iron Addition Trials (Week 12 of Stage 2) on March 25, 2020 for Trials 2, 5, 6, and 7.

Table 4-11: Microbial Sampling Parameters and Frequency

Test Parameters	Frequency	Sample Location	Total Number of Samples	Number of Sampling Events
Quantification analysis & genetic sequencing analysis for bacterial community composition and distribution of beneficial organisms	Initial sample	Initial soil amendment, waste rock composite, & tap water	3	1
	Week 22 (9-Sep-2019) of Stage 1	Water of Trials 2 - 6	5	1
	Week 34 (4-Dec-2019) Stage 1	Water and substrate of Trials 3 & 4	4	1
	Week 12 (25-Mar-2020) of Stage 2	Water and substrate Trials 5 & 6 Substrate for Trials 2 & 7	6	1

Samples were collected into sterile syringes and Sterivex™ filters (water), and sterile sample tubes provided by the Ensero microbiology laboratory. Sterivex™ filters of 0.2 µm pore size were used to collect the suspended bacteria in a known volume of water into the filter. Sample collectors wore clean and new nitrile gloves when collecting each sample. Sampling containers were capped immediately after filling. All samples were collected in labelled bottles that identified the sample location, date, and time of collection. COC forms were completed at the time of sampling and contained all information from the sample container labels. COCs signed by the sampler were packed inside the coolers used to immediately transport samples to the laboratory. All microbiology samples were stored in a -20°C freezer prior quantification and genetic sequencing analysis at the Ensero microbiology laboratory according to methods outlined in Appendix C.

All water samples collected from the trials were sampled at approximately the same depth as routine water sampling occurred (one-third to half-way down the water column; Section 4.5.1) using a sterile syringe and Sterivex™ filter. Substrate samples were collected at takedown of the trials by using a pump to drain two-thirds of the water out of the barrel and collecting the substrate into sterile containers.

4.5.4 SCANNING ELECTRON MICROSCOPY SAMPLING

Upon take down of Trials 3, 4, and 8 on December 4, 2019, the top layer of soil substrate was collected for scanning electron microscopy (SEM) analysis. These trials were selected since they each received 10 kg of soil, which presents a larger mass from which to sample and observe products of microbial reduction under the electron microscope. No significant biogenic precipitate formation was visually observed on the rock surfaces at the end of Trials 1, 2, 5, and 6. Given the relatively low COPI concentrations, the production of significant biogenic mineral was not expected. The material was collected underwater to keep the samples from being exposed to air until preparation for SEM analysis could occur at the Saskatchewan Research Council. Prior to being sent for analysis at the Saskatchewan Research Council, the samples were spread as thin layers on carbon tape secured to aluminum sample stubs. This work was performed in an anaerobic bag filled with nitrogen gas to minimize sample oxidation by ambient air. Once mounted, the samples were transferred to anaerobic containers that were flushed with nitrogen and submitted to the Saskatchewan Research Council for SEM analysis.

4.5.5 GEOCHEMICAL MODELLING

The calculated Eh and measured pH of all eight trials at Week 14 was plotted on an Eh-pH predominance plot for the COPI-sulphur-carbon-oxygen system to understand the mechanisms of COPI removal observed under the reducing conditions present at Week 14. All Eh-pH plots were prepared using PHREEPLOT (Kinniburgh and Cooper, 2011) calculated using PHREEQC and based on the Minteq (v4) thermodynamic database. The Minteq database was supplemented with hydrozincite $[\text{Zn}_5(\text{CO}_3)_2(\text{OH})_6]$ data sourced from the LLNL database and additional environmentally relevant uranium species from Guillaumont et al. (2003) and Dong and Brooks (2006). The arsenic Eh-pH plot was generated using the Wateq database owing to its updated and wider range of arsenic species thermodynamic data (Nordstrom and Archer, 2003). The Wateq database was also supplemented with thioarsenic thermodynamic data from Helz and Tossel (2008). Metal and sulphur concentrations were set based on the dissolved concentrations observed at the start of the experiment and the system was allowed to equilibrate with atmospheric carbon dioxide (i.e., the carbon dioxide partial pressure was set at $10^{-3.4}$).

4.6 STAGE 3 IRON ADDITION BENCH TRIALS

The ferric iron addition in the Stage 2 *in situ* pilot-scale barrel trials showed relatively limited arsenic removal compared to that expected. It was hypothesized that this may be due to insufficient mixing within the barrel and limited opportunity for interaction of the ferric iron with dissolved arsenic. Therefore, at the end of the *in situ* pilot-scale barrel trials, two bench trials were performed to evaluate the extent of arsenic treatment under conditions where better mixing could be attained. The bench trials were performed using synthetic influent (Section 4.2; Table 4-3) for the trials containing 10 grams of soil. A 4 L volume of reverse osmosis water was used to create the synthetic influent. The synthetic influent was monitored daily using a pH meter until the pH stabilized. Once the pH was stable, the synthetic influent was sent to BVL in Burnaby, BC for total and dissolved metals analysis to confirm its major and trace element content, and calculate the ferric iron dosage. The synthetic influent was stored sealed in a fridge at 4°C for 14 days during this time. Following receipt of initial water chemistry, the synthetic influent was equilibrated to room temperature while mixing on a stir plate. An initial sample of the synthetic influent was taken for total and dissolved metals to confirm the initial chemistry and the synthetic influent was separated into two 1.5 L aliquots for the trials. Iron to arsenic mass ratios of 20:1 and 10:1 were targeted for the two trials, respectively, by dosing iron (III) sulphate into each trial while stirring. Stirring was stopped after five minutes and a grab sample of each trial was taken for total and dissolved metals at 1, 24, and 144 hours after iron addition as described in Section 4.5.1.

5. RESULTS AND DISCUSSION

5.1 STAGE 1 IN SITU TREATMENT TRIALS

5.1.1 EXPLANATORY PARAMETERS

Explanatory parameters such as DO, ORP, dissolved organic carbon (DOC), pH, and alkalinity are characteristics of a specific environment that describe conditions in the context of how these parameters can affect the chemical reactions taking place. These parameters, when in specific ranges, can be used to predict and/or promote certain reactions in the aquatic environment.

In the ABM Lake pilot-scale trials, reducing conditions are targeted to promote the reduction of sulphate, selenium, and uranium and the subsequent precipitation of COPs as sulphide minerals. Reducing conditions are indicated by low DO concentrations (typically less than 1 mg/L) and depressed ORP values (Christensen et al., 2000). Measurements taken at different depths of the water column (Section 4.5.1) show that measurements were consistent through the water column (Appendix B, Table B1-1). Therefore, further discussion of DO and ORP are for measurements from the middle of the water column. At the start of the experiment, all trials were characterized as aerobic (oxidizing) environments (DO greater than 1 mg/L and ORP greater than +50 mV). Reducing conditions were achieved by the first sampling event (Week 2), with DO concentrations ranging from 0.04 to 0.08 mg/L (Figure 5-1) and ORP ranging from -164 to -42 mV (Figure 5-2), for all carbon dosed trials except for the cold-temperature Trial 5, which had an ORP that remained above +90 mV until Week 14. Cold temperature trials achieved reducing conditions by Week 14, with the longer time period expected based on slower microbially mediated reactions at cold temperatures.

Room temperature carbon-dosed trials experienced an increase in DO and ORP at Weeks 4 to 6 (Figure 5-1 and Figure 5-2), coincident with the consumption of dosed carbon (Figure 5-3), indicating that some re-oxygenation was occurring from the atmosphere. The DOC in the room temperature carbon amended trials had been mostly consumed by Weeks 4 to 6, while DOC in the cold temperature Trial 5 was consumed by Week 8 reflecting the slower microbially mediated reactions at cold temperatures (5°C). As such, a second glycerol dose was added to all carbon amended trials (Trial 1 to 6) in Week 11, and reducing conditions were re-achieved in Trials 2 to 6 from Week 14 to 16 (Figure 5-1 and Figure 5-2). The spike in DOC at Week 12 reflects the additional glycerol added in Week 11, which is mostly consumed by Week 14 to 16 in the room temperature trials and by Week 18 in Trial 5, coinciding with reducing conditions in the trials. Carbon was no longer added after Week 11 and the trials became carbon limited over time. Reducing conditions (i.e., DO less than 1 mg/L) generally persisted for 6 to 8 weeks following each carbon dose. This relatively short duration is a function of the size of the pilot-scale trials which had a water column depth of approximately 0.7 m. This relative short depth allows for more rapid infiltration of atmospheric oxygen throughout the water column. ABM Lake will be considerably deeper, allowing for greater protection of deeper treated water from the atmosphere and so extending the period over which the majority of lake water will be reducing. Furthermore, carbon injections would be timed to occur prior to ice formation on the lake. This will provide a barrier to oxygen ingress and allow for reducing conditions to persist over many months rather than the 6-8 weeks observed in the laboratory trials. Further discussion of the conceptual implementation of *in situ* treatment of ABM lake are provided in Section 7.

In the control trials (Trials 7 and 8) the DO had not changed substantively after 34 weeks of monitoring and the ORP was reflective of oxidizing conditions, consistent with the lack of carbon added to these control experiments. The baseline DOC in the tap water was approximately 3 mg/L, as noted in the controls Trials 7 and 8 (Figure 5-3).

Figure 5-1: Dissolved Oxygen Values in the Pilot-scale Trials Stage 1 from Weeks 0 to 34

Figure 5-2: Oxidation Reduction Potential Values in the Pilot-scale Trials Stage 1 from Weeks 0 to 34

Figure 5-3: Dissolved Organic Carbon Concentrations in the Pilot-scale Trials Stage 1 from Weeks 0 to 34

The initial pH of the trials ranged between 6.9 and 7.4 (Figure 5-4). Once reducing conditions were established (Week 2), the pH of Trials 1 through 6 decreased to between 6.3 and 6.5 by Week 4. This is likely due to the production of organic acids (e.g., acetate) during the oxidation of glycerol. The pH in Trials 1 through 6 remained between 6.2 and 6.6 until Week 18, after which the pH increased slowly to between 6.6 and 7.2 by Week 34. The pH of the control Trials 7 and 8 showed limited variation and largely maintained their initial pH through the trials (pH 7.2 and 7.0, respectively). Higher pH is expected in the full-scale implementation of *in situ* treatment in ABM Lake. Fault Creek water is the largest single contributor to ABM Lake, suggesting the pH of ABM Lake will be similar to that of Fault Creek (7.2 to 8.2; median 7.8; AEG, 2019a) which is higher than the pH of the control Trials 7 and 8. Furthermore, minimal pH decrease is expected following glycerol addition to ABM Lake since it would take place over a number of weeks allowing the system to adequately buffer the effects of any intermediate organic acid production, versus the pulse addition used in the pilot-scale trials.

Acidity from the formation of these intermediate organic acids was adequately buffered by the alkalinity formed as a by-product of the mineralization of organic carbon by sulphate-reducing bacteria. The alkalinity concentrations in all trials except Trial 1 remained relatively stable until the second glycerol addition in Week 11, at which point alkalinity increased in Trials 2, 3, 4, 5, and 6 (Figure 5-5). Alkalinity in Trials 2, 3, 4, and 6 remained stable from Week 14 to 18 through to Week 34, while alkalinity in Trial 5 remained stable after Week 22. Trial 1, on the other hand, decreased by approximately 20 mg/L between Weeks 4 and 6, and then increased after the second glycerol addition and remained stable through to Week 34 (Figure 5-5). As expected, alkalinity levels increased more slowly in the cold temperature Trial 5, corresponding with slower organic carbon depletion. Alkalinity in Trials 7 and 8 also increased slightly over time, indicating an inherent microbial activity and subsequent organic carbon mineralization.

Figure 5-4: pH Values in the Pilot-scale Trials Stage 1 from Weeks 0 to 34

Figure 5-5: Alkalinity Concentrations in the Pilot-scale Trials Stage 1 from Weeks 0 to 34

5.1.2 MANGANESE AND IRON

Manganese and iron are important indicators of microbial activity and of the achievement of reducing conditions, shown by increases in dissolved manganese and ferrous iron concentrations (Londry, 2013). As manganese and iron are held in the substrate as (hydr)oxides, the development of more reducing conditions typically result in their transient release as the host phases are dissolved under manganese- and iron- reducing conditions.

In the pilot-scale test work completed up to Week 34 (Stage 1), dissolved and total manganese concentrations were comparable (Figure 5-6), indicating that the bulk of the manganese in the water is in the dissolved form. The trials containing 10 kg of soil (Trials 3, 4, and 8) had higher initial manganese content in the water due to some manganese release from the soil. Manganese concentrations gradually increased in the glycerol spiked trials (Trials 1 through 6) as manganese-reducing conditions were established, resulting in some dissolution of oxidized manganese minerals in the rock and/or soil substrate added to each trial. Following consumption of the added DOC (Week 16 to 18), dissolved manganese concentrations slowly decreased in all carbon amended trials, except Trial 6 in which dissolved manganese continued to rise slowly. Manganese concentrations slowly declined in the control Trial 7, as the dissolved manganese slowly oxidized, likely forming manganese (oxyhydr)oxide phases that settled out of the water column. Manganese concentrations declined in the control Trial 8 until Week 22 and slowly increased until Week 34. The mechanism for this increase is unclear; however, the 10 kg soil mass added to control Trial 8 likely included labile organic carbon which may foster reducing niches within the saturated soil, causing the release of a portion of the precipitated manganese back into solution.

Figure 5-6: Dissolved and Total Manganese Concentrations in the Pilot-scale Trials Stage 1 from Weeks 0 to 34

The larger soil addition to Trials 3, 4, and 8 (control) is expected to provide a source of reducible iron to the system that may assist in metals removal and extend treatment longevity by creating a pool of labile iron sulphide that acts as a redox buffer to the ingress of oxidants. Dissolved iron concentrations comprised a small fraction of the total iron content at the start of the trials (Figure 5-7) as particulate oxidized iron (total) phases dominated the iron present in the water column. Once the trials were amended with glycerol, there was a marked increase in dissolved iron at Weeks 2 and 4 in all the room temperature trials (Trials 1 to 4 and 6). This was generally coincident with a peak in dissolved ferrous iron (Figure 5-8), indicative of the development of iron (III)-reducing conditions. Trials 3 and 4 had

the highest dissolved iron and ferrous iron concentrations during reducing conditions due to the increased leachable iron from the soil. However, by Weeks 14 to 16, Trial 5 dissolved iron and ferrous iron concentrations were more similar to Trials 3 and 4.

Dissolved iron and ferrous iron concentrations declined over Weeks 6 to 10 in the room temperature carbon amended Trials 1 through 4, consistent with re-oxygenation and the resulting oxidation of ferrous iron to ferric iron, which is highly insoluble at the circumneutral pH of the trials. Only a moderate decline in dissolved iron over the same period was noted for Trial 6 (the 10x water quality model concentration trial), which appeared to exhibit limited re-oxidation over this period based on its lower DO and ORP values (Figure 5-1 and Figure 5-2). Conversely, in Trial 5 (5°C) dissolved iron and ferrous iron increased between Weeks 6 and 10, as, due to the slowed consumption of organic carbon at the lower temperature, the trial was not as affected by the oxidizing conditions.

Dissolved iron and ferrous iron concentrations increased following the carbon top-up in Trials 2 to 6, which then declined again after DOC was consumed. Dissolved and ferrous iron concentrations were elevated between Weeks 12 to 16 for the room temperature Trials 2 to 4, and Weeks 14 to 18 for the cold temperature Trial 5. Dissolved iron concentrations were elevated between Weeks 14 to 16 for Trial 6, while low ferrous iron concentrations (approximately 0.07 mg/L), persisted until Week 22. Dissolved iron concentrations in Trial 1 increased to a lesser degree compared to the other trials following the carbon top-up. However, ferrous iron concentrations were not measured in Trial 1 following the carbon top-up, which coincides with no measurable DOC. Therefore, Trial 1 did not re-establish strong reducing conditions following the carbon top-up. As the dissolved iron concentrations slowly decreased after the consumption of DOC, the total iron concentrations in Trials 1 to 6 slowly decreased as oxidized iron forms precipitated and settled.

The control Trials 7 and 8 contained very little dissolved iron (less than 0.01 mg/L) and no detectable ferrous iron, consistent with their predominantly oxidizing conditions in the absence of carbon amendment. Total iron concentration in the control Trials 7 and 8 decreased slowly as the predominantly oxidized forms of iron settled.

The total iron concentrations in each carbon dosed trial showed relatively little overall net change while these trials were reducing, suggesting that little iron was removed from the water column under reducing conditions.

Figure 5-7: Dissolved and Total Iron Concentrations in the Pilot-scale Trials Stage 1 from Weeks 0 to 34

Measurements less than the detection limit of 0.001 mg/L are indicated by a hollow marker.

Figure 5-8: Dissolved Ferrous Iron Concentrations in the Pilot-scale Trials Stage 1 from Weeks 0 to 34

Measurements less than the detection limit of 0.05 mg/L are indicated by a hollow marker.

5.1.3 SULPHUR SPECIES

The sulphate and sulphide concentrations in the water are an important marker to identify COPI removal, which is driven by sulphide mineral precipitation. Generally, sulphate concentrations remained relatively stable in all trials for the first 12 Weeks of operation (Figure 5-9), but declined by ~15% in Trials 3 and 4 by Week 34, coincident with a marked increase in sulphide concentration (Figure 5-10). The appearance of detectable sulphide concentrations in the four to six weeks following each carbon injection (i.e., Weeks 2, 4, 12, 14, and 16) is indicative of the development of sulphate-reducing conditions in the carbon amended trials. However, Trial 5 produced appreciable amounts of sulphide only after the carbon top-up. Sulphide production in Trial 6 was generally delayed and resided longer after the first carbon addition compared to the other trials, which coincides with the elevated dissolved iron concentrations in its water. Relatively low (typically less than 5.6 mg/L) sulphide concentrations and low percent removal of sulphate have been observed to date and are expected since extensive sulphate reduction was not targeted as part of the carbon dose calculations. Sulphide is not anticipated to persist due to its precipitation with dissolved chalcophile elements (e.g., cadmium, copper, zinc), reaction with solid phase iron in the soil and/or rock in each trial to form iron sulphide phases, and oxidation by the slow ingress of oxidized constituents (e.g., DO) over time. As expected, no sulphide was detected in the control Trials 7 and 8.

Figure 5-9: Sulphate Concentrations in the Pilot-scale Trials from Weeks 0 to 34

Figure 5-10: Sulphide Concentrations in the Pilot-scale Trials from Weeks 0 to 34

Measurements less than the detection limit of 0.0019 mg/L are indicated by a hollow marker.

5.1.4 CONSTITUENTS OF POTENTIAL INTEREST

Figures showing the change in COPI concentrations also display the “treatment target” for reference (Table 3-3). These concentrations correspond to the concentrations used in the water quality model following the implementation of *in situ* treatment in ABM Lake (i.e., these are the post-*in situ* treatment concentrations; AEG, 2018).

5.1.4.1 Antimony, Cadmium, Copper, Lead, and Zinc

Reducing conditions also triggered concurrent decreases in chalcophile and sulphide-forming COPIs, namely cadmium, zinc, copper, lead, and antimony (Figure 5-11 to Figure 5-15, respectively; Appendix B, Table B2-1). Treatment for COPIs cadmium, copper, and zinc are discussed in this report in terms of treatment of dissolved concentrations to be comparable against the dissolved concentration treatment targets (consistent with the dissolved form of these elements used for water quality objectives in the receiving environment; AEG and Minnow Environmental, 2020). Following the second carbon addition in Week 11, concentrations of COPIs were generally at their lowest by Week 14 (Figure 5-11 to Figure 5-15). These initial results indicate the formation of poorly soluble mineral phases, such as sulphide minerals greenockite (CdS), covellite (CuS), galena (PbS), and sphalerite (ZnS), for cadmium, copper, lead, and zinc, respectively.

Dissolved concentrations for cadmium, zinc, and copper increased as conditions became more oxidizing; however, concentrations remained below starting concentrations by Week 34 (Table 5-1; Figure 5-11 to Figure 5-13, respectively). Furthermore, percent removal compared to the control at Week 34 (Table 5-1) showed some residual treatment for cadmium, copper (except Trial 1), and zinc (except Trial 1 and 5) despite conditions becoming more oxidizing. Conversely, lead removal was different than the other chalcophiles. By Week 34, the 10 kg soil amended Trials 3 and 4 performed better compared to the respective 0.01 kg soil Trials 1 and 2 due to sorption of lead to the much larger soil mass (Table 5-1; Figure 5-14). However, during reducing conditions, removal of cadmium, copper, and zinc was comparable between the 10 kg and 0.01 kg soil trials as they are removed through the same treatment mechanisms (Table 5-1; Section 5.2).

Discrete antimony sulphide minerals are not expected to form under the conditions observed in the carbon amended trials, and as such, the decreases in antimony experienced in the carbon amended trials (Figure 5-15), and in control Trial 8, suggests co-precipitation with, or sorption on, other sulphide minerals (Section 5.2). The treatment target was achieved for Trials 2, 3, and 4 and maintained up to Week 34 (Figure 5-15). Trials 1, 5, and 6 treated antimony below the treatment target in reducing conditions at Week 14, which were not maintained to Week 34 as Trials 1 and 6 were carbon limited and Trial 5 was at lower temperatures (Figure 5-15).

Overall, the maximum percent removal assumed in the water quality model for cadmium, zinc, copper, lead, and antimony was met or exceeded during reducing conditions in all trials (Figure 5-11 to Figure 5-15, respectively).

¹ Percent removal for Trials 1, 2, and 5 calculated against control Trial 7 at same time points. Percent removal for Trials 3 and 4 calculated against control Trial 8 at same time points. Negative percent removals indicate the concentration was greater than the respective control Trial 7 or 8. Consistent negative percent removal for arsenic is discussed further in Section 5.1.4.3. Negative percent removal observed at Week 34 in some trials for lead and zinc may partly be due to the slightly lower initial starting concentrations in the control trials. Trial 6 does not have a directly comparable control trial for the percent removal calculation as it was designed to contain ten times the metals concentrations of the predicted water quality model and was therefore omitted from this table.

² Maximum observed COPI removal throughout trial.

³ COPI removal at end of experiment (Week 34).

5.1.4.2 Selenium and Uranium

Selenium, which is less soluble as elemental selenium in the reduced state (i.e., low DO and ORP), remained generally stable in the control Trial 7, but decreased in control Trial 8, likely due to some sorption on the 10 kg of soil present in this trial (Figure 5-16; Appendix B, Table B2-1). In trials that were amended with organic carbon and operated at room temperature (Trials 1 through 4 and 6), selenium concentrations decreased in Week 2 (approximately 90% removal), increased slightly over Weeks 4 and 6, were stable until Week 12 and then increased slightly at Week 14 (Figure 5-16). In the cold temperature carbon amended trial (Trial 5), a decrease in selenium concentrations was not observed until Week 8 (Figure 5-16). Trials 1 to 5 met the treatment target during the experiment and Trials 2 to 4 were able to maintain treatment below the target concentration up to Week 34 (Figure 5-16). Trials 1 and 5 likely did not maintain treatment targets based on being carbon limited and at lower temperatures, respectively. Trials 3 and 4 likely maintained treatment targets under oxidizing conditions due to sorption onto soil, consistent with the decrease in selenium levels observed in the control Trial 8. In Trial 6, where the starting concentrations were 10 times that of the water quality model, selenium concentrations were lower than the control Trial 7 in Week 4, 12, and 16 to 18, but above for the other monitoring weeks (Figure 5-16). The lower concentrations of selenium observed in the carbon amended trials is likely due to precipitation of elemental selenium under reducing conditions (Section 5.2).

Uranium, which is less soluble as uraninite in a reduced state, remained generally stable in the control Trial 7, but decreased in control Trial 8 due to sorption on the 10 kg soil (Figure 5-17; Appendix B, Table B2-1). In trials that were amended with organic carbon (Trials 1 through 6), uranium concentrations declined over Weeks 2 and 4, stabilized until Week 10, then declined again following the second carbon addition (Figure 5-17). In the cold temperature carbon amended trial (Trial 5), a decrease in uranium concentrations following the second carbon addition occurred at Week 14, due to slower microbial activity at lower temperatures (Figure 5-17). Trials 2 to 4 met the treatment target during the experiment and were able to maintain treatment below the target concentration up to Week 34 (Figure 5-17). However, at Week 34, Trial 2 uranium concentrations approached the treatment target as it became carbon limited (Figure 5-17). Trials 3 and 4 likely maintained treatment targets under oxidizing conditions due to sorption onto soil, consistent with the decrease in uranium levels observed in the control Trial 8 (Figure 5-17). In Trial 6, where the starting concentrations were 10 times that of the water quality model, uranium concentrations remained above control Trial 7 concentrations to Week 34 (Figure 5-17). The lower concentrations of uranium observed in the carbon amended trials is likely due to precipitation of uraninite under reducing conditions (Section 5.2).

Figure 5-17: Total Uranium Concentrations in the Pilot-scale Trials from Weeks 0 to 34

5.1.4.3 Arsenic

Up to Week 34, arsenic did not experience significant removal compared to the control trials (Figure 5-18), which is consistent with predictions for these trials (Section 5.2). In fact, greater arsenic removal was observed in the control Trials 7 and 8 than in the carbon amended trials (Figure 5-18). This may be due to the formation of soluble thioarsenic species under the reducing conditions formed in the carbon amended trials, resulting in less sorption to the rock and soil surfaces within the barrels than that which occurred in the control trials.

Figure 5-18: Arsenic Concentrations in the Pilot-scale Trials from Weeks 0 to 34

5.2 STAGE 2 *IN SITU* TREATMENT TRIALS

5.2.1 ARSENIC TREATMENT

Trials 1, 2, and 5 to 7 were repurposed after the initial 34-week test period for additional Stage 2 iron amendment barrel trials. The purpose of these tests was to determine arsenic removal in the presence of ferric iron supplemented to the trials under reducing or oxidizing conditions. Trials were either amended with soluble ferric iron prior to (Trials 1 and 5) or after carbon dosing (Trials 2 and 6) in a 10:1 (Trials 1 and 2) or 20:1 (Trials 5 and 6) Fe:As mass ratio to assess if the order influenced the extent of arsenic removal (Section 4.4.2).

5.2.1.1 *Ferric Addition Followed by Carbon Amendment*

Trials 1 and 5 were amended with ferric iron to observe arsenic removal under initial oxidizing conditions through sorption and co-precipitation of arsenic to iron (oxyhydr)oxide precipitates that will form following the addition of soluble ferric iron (O'Day, 2006). Carbon was added to these systems at Week 4 to assess whether the development of reducing conditions resulted arsenic re-mobilization due to dissolution of the host ferric (oxyhydr)oxide phase. Continued monitoring over the weeks following carbon addition were used to evaluate if any such arsenic release was a transient event and/or if further arsenic sequestration occurred due to removal with iron sulphides that will likely form under the sulphidic conditions stimulated by the carbon addition.

Trials 1 and 5 showed a 18% and 26% decrease in total arsenic (19% and 40% decrease in dissolved arsenic, respectively) through sorption to iron (oxyhydr)oxides over a four-week period (Table 5-2). Removal of dissolved arsenic in Trial 5 was greater than or similar to Trial 1, thus abiotic arsenic treatment processes were less affected by temperature and may have shown better removal due to the higher ratio of iron added to Trial 5. After Week 4, glycerol was dosed into Trials 1 and 5 and reducing conditions (DO less than 1 mg/L and ORP less than +50 mV) were achieved by Week 6 (Figure 5-19 and Figure 5-20). Arsenic and iron concentrations were observed to increase in Trials 1 and 5 as iron (oxyhydr)oxides were reduced (Figure 5-21 and Figure 5-22) and dissolved, releasing sorbed arsenic. Further removal of total arsenic was observed in Trials 1 and 5 following the initial release after carbon reduction, resulting in 42-45% decrease in total arsenic concentrations by the end of the Iron Addition Trial. Trial 1 continued to exhibit strongly reducing conditions at the end of the Stage 2 (Week 12) as evidenced by its negligible DO, low ORP and elevated concentrations of dissolved iron and sulphide at Week 12 (Figure 5-19, Figure 5-20, Figure 5-22, Figure 5-22, and Figure 5-23, respectively). This suggests that additional arsenic sequestration via sulphide precipitation (likely incorporated into iron sulphides) may be responsible. While not as strongly reducing as Trial 1, the polishing of arsenic concentrations in the latter weeks of Trial 5 may also be due to removal by precipitating sulphide phases, perhaps supplemented with sorption on iron (oxyhydr)oxides that start to re-precipitate as the system begins to re-oxidize.

Table 5-2: Percent Removal of Dissolved and Total Arsenic For Trials 1, 2, 5 and 6 during the Stage 2 *in situ* Treatment Trials

COPI	Percent Removal ¹ (Fe:As Mass Ratio)											
	Ferric addition at Week 0 under oxidizing conditions; Carbon addition after Week 4						Carbon addition at Week 0 to stimulate reducing conditions; Ferric addition after Week 4

5.2.1.2 Carbon Amendment Followed by Ferric Addition

Trials 2 and 6 were amended first with carbon to induce reducing conditions before ferric iron was added. Arsenic removal under these conditions would be expected through sorption to iron monosulphides (e.g., mackinawite) and formation of arsenic sulphides (Edenborn et al., 1986; Moore et al., 1988; Sun et al., 2016). Trials 2 and 6 had become reducing by Week 2 and 4, respectively, as seen through low DO, ORP, increased dissolved iron and sulphide (Figure 5-19, Figure 5-20, Figure 5-22, and Figure 5-23, respectively). Trials 2 and 6 both showed a 36% and 39% decrease in total arsenic (34% and 40% decrease in dissolved arsenic) at Week 4 (Table 5-2). After ferric iron addition on Week 4, Trials 2 and 6 both showed increased removal to 39% and 62% decrease in total arsenic (56% to 58% decrease dissolved arsenic) by Week 5, respectively. Reducing conditions were observed for Trial 6 throughout the rest of the Iron Addition Trial, and removal was maintained to a 62% to 66% decrease in total arsenic (58% to 62% decrease in dissolved arsenic) to the end of the Iron Addition Trial. Conversely, Trial 2 had become oxidizing again by Week 10, and showed an associated increase in total and dissolved arsenic concentration, due to the solubilization of sulphide minerals. By the end of the Iron Addition Trials, Trial 2 showed only a 5% decrease in total arsenic and showed much lower removal than Trial 6 possibly due to the higher iron ratio in Trial 6. However, as dissolved iron oxidized and re-precipitated to iron (oxyhydr)oxides, dissolved arsenic removal through sorption was not observed in Trial 2.

Overall, comparable total arsenic removal maxima were obtained using the 10:1 and 20:1 iron to arsenic ratios, although greater removal of dissolved arsenic was observed at the 20:1 dosing ratio (Table 5-2). This suggests extended settling over time may result in lower total arsenic concentrations for the 20:1 iron to arsenic dosing ratio. While the order of ferric and carbon dosing did not appear to influence the maximum arsenic removal observed, greater removal was observed at the end of Trial 5 for dissolved arsenic (Table 5-2), which received ferric iron first under oxidizing conditions before transitioning to reducing conditions following carbon amendment. Also, the addition of ferric iron to the already reducing Trial 2 resulted in no marked improvement in arsenic removal while the bulk of arsenic removal in Trial 6 was achieved prior to ferric dosing (Figure 5-21).

5.2.2 TREATMENT OF OTHER COPIs

Chalcophile COPIs (total antimony, dissolved cadmium, dissolved copper, total lead) showed no marked removal with ferric iron dosing alone (Figure 5-24 to

Figure 5-27), whereas dissolved zinc exhibited limited removal following ferric iron addition (up to 30% and 0% decrease for Trial 1 and Trial 5, respectively; Figure 5-28). Total selenium and uranium were also not treated with ferric iron dosing alone (Figure 5-29 and Figure 5-30). The transition to strongly reducing conditions subsequent to the iron dosing for Trials 1 and 5 resulted in a strong decline in dissolved antimony, cadmium, copper, lead, and zinc concentrations by between one and two orders of magnitude, to levels that were similar to, or lower than those observed during Stage 1. The decline was quicker for the room temperature Trial 1 than the cold temperature Trial 5, but the overall chalcophile element removal for the cold Trial 5 was similar to (antimony, lead, zinc) or greater than (cadmium, copper) that of Trial 1 by Week 12. This was despite the higher ORP observed for Trial 5, and lower dissolved iron and sulphide concentrations, suggesting it was not as strongly reducing as Trial 1. Trial 5 received a higher iron dose (20:1 iron to arsenic ratio), suggesting that the additional iron assisted in the enhanced cadmium and copper removal observed. No selenium removal was observed in Trial 1 following carbon amendment. Total selenium concentrations were lowered in Trial 5 but rebounded by Week 12 (Figure 5-29). Interestingly, the dissolved selenium concentration for Trial 5 at

Week 12 (0.0014 mg/L) showed removal and was an order of magnitude lower than total selenium (0.013 mg/L), suggesting settling of selenium particulates (likely elemental selenium) over time would result in lower selenium in the water column. Conversely, total uranium removal was observed by Week 12 in Trial 1 (60% lower than Week 0) but was minimal in Trial 5 (8% lower; Figure 5-30).

Trials 2 and 6 received carbon amendment before iron dosing. The carbon addition resulted in marked removal of the chalcophile COPIs total antimony, dissolved cadmium, dissolved copper, and dissolved zinc (Figure 5-24, Figure 5-25, Figure 5-26, and Figure 5-28, respectively). By Week 5, these COPIs were treated below their respective treatment targets to levels that were comparable to or lower than those observed in Stage 1, likely resulting from the strong reducing conditions produced from the higher carbon dose used in Stage 2 compared to Stage 1. Therefore, continued improvement of treatment after ferric iron addition was difficult to observe for these COPIs. While dissolved lead showed some variable removal in Trial 6 prior to iron addition, removal of total lead did not occur until after iron was added (

Figure 5-27). There was no removal of dissolved or total lead in Trial 2 with a Fe:As mass ratio of 10:1, suggesting a 20:1 Fe:As ratio was beneficial to lead removal. Total uranium was treated up to 52% and 16% in Trials 2 and 6, respectively, by Week 4 (Figure 5-30). Further removal of total uranium after ferric addition was observed mainly in Trial 6 (decrease up to 80% of total uranium concentrations by Week 12). Total uranium concentrations in Trial 2 slowly declined to 33% removal by the end of Stage 2. Total selenium was not treated in Trials 2 and 6 by Week 4 (Figure 5-29). Further removal after ferric addition fluctuated, however by the end of Stage 2, Trial 6 had a decrease of 56% of the total selenium while Trial 2 had no removal. Despite its order of magnitude higher initial COPI concentrations, Trial 6 exhibited removal to similar or lower concentrations as those observed for Trial 2 for all COPIs except uranium, indicating that treatment of higher starting concentrations is clearly feasible.

5.3 STAGE 3 IRON ADDITION BENCH TRIALS

Although marked arsenic removal was observed in the pilot-scale trials (Stage 2), higher removal was expected given the affinity of arsenic for iron minerals (O'Day, 2006). The less than expected removal was ascribed to poor mixing and restricted contact to the iron (oxyhydr)oxides in the 200 L barrels. Therefore, the ferric dosing experiment was repeated using smaller scale bench-scale tests to assure intimate mixing between the ferric reagent and the arsenic in solution.

The extent of arsenic removal through ferric iron addition is related to the ratio of iron to arsenic and the initial arsenic concentration (Barabash and Nicholson, 2019). Bench-scale trials of 1.5 L and adequate mixing were further investigated for arsenic removal extent with iron amendment in a mass ratio of 20:1 and 10:1 Fe:As. As expected, dissolved arsenic removal in the presence of iron (oxyhydr)oxide mostly occurred within the first hour for both Fe:As mass ratios (Table 5-3, Figure 5-31). Total arsenic concentrations decreased more slowly, broadly in line with the fall in total iron concentrations (Figure 5-32) requiring about 6 days (144 hours) for total arsenic concentrations to reach dissolved concentrations as the arsenic-bearing ferric iron precipitates settled out. After 6 days, a 20:1 Fe:As ratio decreased total arsenic concentrations by 90%, while a 10:1 Fe:As ratio decreased total arsenic concentrations by 53% due to the lower mass of ferric (oxyhydr)oxide produced. Thus, a 20:1 iron to arsenic ratio is recommended for any full-scale implementation of iron amendment combined with adequate mixing (Barabash and Nicholson, 2019).

Table 5-3: Percent Removal of Dissolved and Total Arsenic for 20:1 and 10:1 Fe:As Mass Ratio Stage 3 Bench-scale Trials

COPI	Percent Removal					
	20:1			10:1		
	1 hr	24 hrs	144 hrs	1 hr	24 hrs	144 hrs
Dissolved Arsenic	91%	94%	94%	54%	41%	56%
Total Arsenic	1%	48%	90%	-3%	11%	53%

5.4 COPI TREATMENT MECHANISMS

Eh (i.e., redox potential) and pH are master variables that exert a strong influence on the mobility of trace elements including the COPIs. The mechanisms of COPI removal can be visually understood when the samples are plotted in Eh-pH space. Although ORP is a useful qualitative indicator of changes in redox conditions over time, it is known to be unreliable when determining the actual redox state due to uncertainties in the redox couple to which it is responding and the relative insensitivity of the platinum electrode in the ORP device to some redox couples (e.g., sulphate/sulphide; Lindberg and Runnells, 1984). As such, the Nernst equation was used to calculate the *in situ* Eh for samples collected at Week 14 when COPI removal was most prominent in the carbon amended trials. Sulphide concentrations over two orders of magnitude higher than the detection limit were present in Trials 2 through 6 at Week 14 (Figure 5-10), suggesting sulphate reduction was a significant process in these trials. Therefore, the Eh for Week 14 of these trials was calculated using the sulphate/sulphide redox couple, since the presence of detectable sulphide is indicative of sulphate-reduction and use of the redox couple with the lowest potential has been shown to yield more accurate Eh measurements in past work examining groundwater redox geochemistry (Jackson and Patterson, 1982). No detectable sulphide or ferrous iron was present at Week 14 of Trial 1 or the control Trials 7 and 8. These three trials had detectable nitrate and dissolved oxygen and shared similar ORP at Week 14 (Figure 5-1, Figure 5-2). As such, they are more oxidizing than the other trials, which is expected for the carbon-free control Trials 7 and 8 and three months removed from the initial carbon addition to Trial 1 and lack of response to the second carbon addition to Trial 1. Given the oxidized conditions present, the measured ORP was used to calculate the Eh in these three trials.

The calculated Eh and measured pH of all eight trials at Week 14 was plotted on an Eh-pH predominance plot for the COPI-S-C-O system (Figure 5-33 and Figure 5-34). The Eh-pH plots indicate the dissolved species or solid phases that the source thermodynamic data dictate to be predominant at a given Eh and pH. The plots are based on thermodynamic data; they do not consider reaction kinetics, however, kinetically-inhibited phases were not included. Figure 5-33 and Figure 5-34 display the Eh-pH plots for COPIs and iron.

The control Trials 7 and 8 all plotted in soluble species stability fields in the COPI Eh-pH plots, indicating that under the prevailing pH and Eh conditions at Week 14 (and generally throughout these control trials) the COPIs remained soluble. Only iron plotted in a stable mineral stability field [ferrihydrite – nominally $\text{Fe}(\text{OH})_3$], which was reflected in the low dissolved iron concentrations present in Trials 7 and 8 that were one to two orders of magnitude lower than in the glycerol-amended trials (Figure 5-7). The Week 14 Trial 1 Eh and pH also plotted in the soluble COPI species fields owing to the lack of development of reducing conditions following its carbon top up; however, the lower Eh recorded during the early weeks of this trial from the initial carbon dose resulted in COPI precipitation. As such, the COPI concentrations were lower in Trial 1 at Week 14 than those in the control Trials 7 and 8 due to the lasting effects of COPI precipitation earlier in this trial.

The lower Eh calculated for Trials 2 through 6 resulted in the formation of poorly soluble mineral phases. For example, at the Eh and pH conditions of Week 14 the chalcophile (i.e., elements that tend to form sulphide minerals) COPIs cadmium, copper, lead, and zinc plotted in the stability field of their sulphide minerals greenockite (CdS), covellite (CuS), galena (PbS), and sphalerite (ZnS), respectively (Figure 5-33). As such, it is likely that the diminution in dissolved concentrations of these elements observed for Trials 1 through 6 is due to precipitation of these sulphide minerals. Similarly, following reduction to their lower valence states, selenium and uranium form poorly soluble elemental selenium [$\text{Se}(0)$] and uraninite (UO_2), respectively

(Figure 5-33). The lower concentrations of these two elements observed in the carbon amended trials is likely due to precipitation of these phases.

Interestingly, the antimony Eh-pH plots suggest that discrete antimony sulphide minerals are not expected to form under the conditions observed in the carbon-amended trials (Figure 5-34). That antimony removal was observed suggests that these chalcophile elements likely co-precipitated with, or sorbed on, other sulphide minerals. Arsenic did not experience significant removal. Under the reducing, sulphidic conditions at Week 14 in Trials 2 through 6, soluble arsenite [H_3AsO_3] and tetrathioarsenate (AsS_4^{3-}) are the predominant forms (Figure 5-34). No insoluble arsenic minerals were predicted at the Eh and pH conditions of these trials, and iron sulphide formation, into which arsenic may be sequestered, was also not predicted to be widespread (Figure 5-34). This was anticipated and no arsenic removal was predicted for *in situ* treatment (Figure 5-34). Indeed, the data suggest iron sulphide formation (as mackinawite; FeS) was not favoured; Trials 2 through 6 plotted in the ferrous iron stability field (Figure 5-34), consistent with the elevated dissolved iron present in Trials 2 through 6 for Week 14 (Figure 5-7), which exclusively comprised ferrous iron (Figure 5-8). This is due to the relatively low iron levels in the water column, resulting in minimal oversaturation with respect to iron sulphide phases, although FeS formation likely occurred within the soil mass for Trials 3 and 4 that were charged with 10 kg of soil (further described in Section 5.5.3).

Arsenic removal was observed under oxidizing conditions in Stage 2 and Stage 3 due to sorption on (and probably some co-precipitation with) ferric (oxyhydr)oxides that form under oxidizing conditions (i.e., ferrihydrite). The additional arsenic sequestration observed under reducing conditions in Stage 2 is likely due to sorption on and incorporation within iron sulphides that formed from the additional iron added to these experiments.

5.5 SOILS

5.5.1 ACID VOLATILE SULPHIDES AND SIMULTANEOUSLY EXTRACTED METALS

The formation of sulphide minerals with chalcophile metals in reducing conditions can be measured through tests for acid volatile sulphides (AVS) and the sum of simultaneously extracted metals (Σ SEM; cadmium, copper, lead, mercury, nickel, zinc). When excess sulphides are generated in the presence of excess iron, the iron bound AVS formed is stored in soils as excess AVS for future use in metals removal in an on-demand manner. The excess AVS are biogenically formed amorphous iron sulphides. The amorphous structure and solubility constant of the iron bound AVS results in the sulphide preferentially exchanging iron for heavy metals with a greater affinity for the sulphide (e.g., copper, zinc) which are then stably bound.

AVS in the sample of the starting soil inoculum was below detection (i.e., less than 0.2 $\mu\text{mol/g}$; Figure 5-35; Appendix B, Table B3-1); however, this sample was collected from soil material that had been stored for approximately 10 months during the experiments owing to the minimum sample number required by the laboratory for AVS analysis. Although the soil material was refrigerated during storage and the sample was collected from approximately 15 cm depth from the soil column within the storage pail, the AVS present may have oxidized during storage. The highest amount of AVS was measured in Trial 3 (24.6 $\mu\text{mol/g}$), which was more than double that present in the control Trial 8 soil (10.9 $\mu\text{mol/g}$) at the end of the experiment (Figure 5-35), indicating that carbon amendment to this trial resulted in the accumulation of AVS under the sulphate reducing conditions that were stimulated. Although Trial 4 received a higher carbon dose, the AVS measured in its soil at the end of the experiment (9.0 $\mu\text{mol/g}$) was comparable to that of the control (Figure 5-35). This suggests that either AVS formation was not significant in the experiment or that the AVS was oxidized in the last few weeks of the experiment when re-oxidation of the overlying waters was observed. These explanations are counterintuitive given the Trial 3 AVS results, which exhibited comparable water chemistry to Trial 4; instead, sample heterogeneity is likely responsible for this result. The measurable AVS present in the control Trial 8 probably reflects the presence of AVS in the initial soil material since it was sourced from a waterlogged area of the Kudz Ze Kayah site which likely contained AVS. The maintenance of such saturated conditions under the water cover in the experiment would have preserved much of the AVS while the likely presence of labile organic carbon in the soil may also have allowed for some additional AVS to be produced during the trial, but at levels that did not change the redox status of the overlying water.

Figure 5-35: Acid Volatile Sulphides Measured in the Soils of Trials 3, 4, and 8 at the end of Week 34

Figure 5-36: Sum of Simultaneously Extracted Metals to Acid Volatile Sulphide Ratio Measured in the Soils of Trials 3, 4, and 8 at the end of Week 34

If a soil has a molar ratio of $\Sigma\text{SEM}:\text{AVS}$ less than 1, then there is excess AVS and it is theoretically capable of exchanging iron for COPIs that are simultaneously extracted. In this way the AVS can serve as a buffer to oxidation should the sediments of a reducing (sulphide-producing) lake system be exposed to oxygen or become carbon limited, thereby making sequestered metals less likely to re-solubilize. Excess AVS in Trials 3, 4, and 8, suggests that excess iron bound AVS was present in all samples (Figure 5-36). Trials 3 and 4 had excess AVS ($\Sigma\text{SEM}:\text{AVS}$ less than 1) after 34 weeks and exhibited the lowest $\Sigma\text{SEM}:\text{AVS}$ ratios (0.13 and 0.23, respectively), indicating there was iron sulphide buffering potential against COPI sulphide oxidation in these trials (Figure 5-36). Excess AVS was also measured in the control Trial 8 at the end of 34 weeks ($\Sigma\text{SEM}:\text{AVS}$ of 0.33; Figure 5-35) and likely resulted from initial AVS in the soil that was preserved under water.

5.5.2 TESSIER SEQUENTIAL EXTRACTION

Under the sulphate-reducing conditions of the experiments, chalcophile metals will precipitate as sulphide minerals, which are extracted in Fraction 4 of the Tessier sequential extraction scheme (Table 4-10). Additionally, metals within Fraction 3 can transition into Fraction 4 as iron and manganese (oxyhydr)oxides linked with Fraction 3 are reductively dissolved and chalcophile COPIs associated with these phases are released before being re-sequestered as sulphide minerals under sulphate-reducing conditions.

The distribution of COPIs between the Tessier sequential extraction fractions is displayed in Figure 5-37 to Figure 5-39 (Appendix B, Table B3-2). Despite the development of sulphate reducing conditions in the water column of Trial 4, there was minimal to no change in the distribution of COPIs between the soil fractions extracted by the Tessier procedure in Trial 4 compared to control Trial 8 (Figure 5-37 to Figure 5-39). This may be related to the relatively short duration (approximately 9 weeks for Trial 4) that the trials maintained reducing conditions. Reducing conditions are likely to be maintained longer in the full-scale system, thus treated chalcophiles and co-precipitated metals are likely to be sequestered into Fraction 4.

Chalcophile COPI metals expected to be treated into Tessier Fraction 4 (Cd, Cu, Pb, Sb, Zn) generally showed no increase in distribution into Fraction 4 or other fractions in Trial 4 compared to the control and starting soil inoculum sample (for cadmium, copper, lead, and zinc) (Figure 5-37). The bulk of cadmium and zinc in the soils of both trials was associated with Fraction 3 (55% to 75%), reflecting the affinity of these metals for iron (oxyhydr)oxide surfaces (Figure 5-37). A sizeable proportion of the lead in the trials was also associated with Fraction 3 (30%), while 40% was found in Fraction 2, likely present as a carbonate phase (Figure 5-37). Copper was primarily found in Fraction 4 in both trials (40% to 55%), with smaller amounts in Fraction 3 (15% to 20%; Figure 5-37). Although this may indicate that copper is present as a sulphide phase in these soils, Fraction 4 also co-extracts organic material with which copper is commonly complexed. Therefore, this likely reflects copper-organic matter association rather than a sulphide predominance.

Antimony was mostly in the residual Fraction 5 in both trials (approximately 70% Figure 5-38), which is resistant to mobilization. Although antimony apportionment amongst the Tessier extraction pools was similar for Trials 4 and 8 (i.e., primarily bound in Fraction 5), antimony in the initial soil inoculum sample was relatively evenly distributed amongst the five Tessier fractions (Figure 5-38). It is unlikely that antimony was redistributed to Fraction 5 during the trials since this fraction comprises silicate and oxide minerals that are only released under strongly acidic conditions and which are unlikely to form under the low temperature conditions and short period of time over which the trials were conducted. Therefore, the difference in antimony allocation between the Tessier fractions is likely due to sample heterogeneity.

Selenium and uranium COPs were expected to be treated in reducing conditions through microbially mediated reduction to less soluble forms. Selenium generally showed no difference in distribution in Fraction 4 in Trial 4 compared to the control, however showed an increase compared to the starting soil inoculum, suggesting co-precipitation or sorption to iron mineral and organic forms (Figure 5-39). Selenium minerals in the trials were mostly distributed in Fraction 5 (40%) and lower amounts in Fraction 4 (20% to 35%; Figure 5-39). Uranium generally showed no difference in distribution in Fraction 2 and 3 in Trial 4 compared to the control Trial 8 (Figure 5-39), however showed an increase in Fraction 2 and decrease in Fraction 3 compared to the starting soil inoculum. Overall, uranium was mostly distributed in the residual Fraction 5 (50-70%) and smaller amounts in Fraction 2 (15% to 30%; Figure 5-39).

Arsenic was not expected to be removed under the tested reducing conditions. Thus, similar distribution of arsenic in Trial 4 compared to the control and initial soil inoculum is consistent with no treatment at Week 34 (Figure 5-38). Arsenic minerals were mostly distributed in Fraction 5 for both trials (60% to 70%; Figure 5-38).

5.5.3 SCANNING ELECTRON MICROSCOPY

Scanning Electron Microscopy (SEM) images, with associated energy dispersive X-ray (EDX) spot analyses, for samples collected from Trials 8, 3, and 4 are shown in Figure 5-40 to Figure 5-42, respectively. Consistent with the sulphate-reducing conditions observed temporarily in Trial 4, the formation of biogenic iron sulphide mineral phases was observed under the electron microscope in the form of micron to sub-micron sized iron sulphide with trace zinc sulphide phases. No other COPI mineral phases were observed due to their relatively low concentration compared with the SEM-EDX detection limits (typically 1 wt.%).

SEM-EDX analysis of the original soil inoculum that was refrigerated following collection in the field showed micron to sub-micron sized ferric (oxyhydr)oxide particles with detrital aluminosilicate grains (Figure 5-40). Similar results were obtained for the soil material collected from the control Trial 8 (Figure 5-40). No freshly formed metal sulphide minerals were observed in either sample. These observations are consistent with the oxidation experienced by the soil during storage and the oxic nature of the control Trial 8.

Metal sulphide minerals were also not observed in Trial 3. Aggregates of nanoparticulates were observed under the SEM (Figure 5-41), which returned a strong iron (and oxygen) signature in the EDX spectrum. The morphology and X-ray spectrum is suggestive of freshly formed iron (oxyhydr)oxide, likely precipitated as the system gradually re-oxidized. Although traces of sulphur were detected in the EDX spectrum, this may be due to gypsum (CaSO_4) formation rather than iron sulphide precipitates.

Evidence for biogenic iron sulphide formation was observed in the EDX spectra of samples collected from Trial 4. These displayed strong iron and sulphur peaks in their X-ray spectra with much lower oxygen levels (Figure 5-42), suggestive of an iron sulphide phase. The SEM images show micron and sub-micron structures whose poorly defined structure points towards a recently precipitated phase, likely of biogenic origin. There is also evidence of trace zinc content in the EDX data (Figure 5-42), consistent with zinc removal via sulphide precipitation. Of all the COPIs, zinc was present at the highest concentration in the overlying water and despite its sequestration during the trial, it was not expected to be strongly detected in the soil given the qualitative detection limits of the SEM-EDX (typically 1 wt.%). The bright contrast of these phases indicates they are electron dense (i.e., contain heavier elements such as iron) relative to the duller grains in the images, which are likely composed of detrital aluminosilicate mineral assemblages responsible for the silicon, aluminum, oxygen, and other light element peaks in the EDX spectra.

A few spot analyses of the Trial 4 material also returned SEM images of sub-micron particle assemblages with an EDX spectrum indicative of iron (oxyhydr)oxide (Figure 5-42). The nanoparticulate morphology and agglomeration is suggestive of freshly deposited mineral which likely formed during re-oxidation of the trial with associated oxidation of ferrous iron and precipitation of ferric (oxyhydr)oxides.

The presence of iron sulphide material in Trial 4 is consistent with the AVS results for this material and the strongly reducing conditions observed for this trial as evidenced by the high sulphide concentrations in the water column (Figure 5-10). However, the lack of iron sulphide identifiable by SEM-EDX in Trial 3 is at odds with the AVS data which found the highest AVS content in material collected from Trial 3 (Section 5.5.1). This discrepancy is likely due to the nature of SEM-EDX analysis, which is conducted on a spot by spot basis within a small sample (less than 0.1 g). Therefore, more weight is ascribed to the AVS results, which were obtained from a larger sample mass (approximately 10 g).

5.6 MICROBIOLOGY

Specific types of bacteria have been evaluated in the substrate and water of the *in situ* treatment trials to inform removal mechanisms that are occurring. Background information on the targeted removal mechanisms and bacteria involved in these biogeochemical reactions is provided in Section 3.4. DNA testing can be used to quantify and identify all bacteria in a sample, along with their relative abundance as a percentage of the community (Section 4.5.3). This reveals whether the desired types of bacteria are present in the community, and if there is biodiversity for the community to adapt to environmental change while maintaining the desired treatment pathways. In other words, diversity in beneficial microbes is favourable and can be regarded as a measure of robustness to conduct a given biogeochemical function, as multiple different bacteria will be able to carry out the beneficial reaction under a wider range of conditions than a small diversity of bacteria could. Key findings of microbial analyses for the *in situ* treatment trials are provided in the following sections. Specific trials were selected for microbiology evaluation based on results through the trials, specifically Trials 2 to 7 (Section 4.5.3).

5.6.1 SULPHIDE-PRODUCING BACTERIA

Sulphide-producing bacteria (SPB) were present in the substrate of Trials 2 to 5 at the end of their testing periods, as well as in the water during the trials (Figure 5-43). The abundance and diversity of SPB were higher in substrate samples in the carbon-dosed Trials compared to the control Trial 7 substrate (Figure 5-43). The addition of carbon therefore promoted the development of SPB and supports removal of COPIs through sulphide production.

SPB were present in all initial samples, with the soil inoculum from site having a high inferred abundance and diversity of SPB which was a source for SPB that established in the Trials (Figure 5-43). The amount of soil inoculum added to the trials impacted the inferred abundance in the substrate samples at take-down, with higher abundance measured in Trials 3 and 4 which had the higher (10 kg) soil inoculum. However, this did not have a notable impact on the treatment of chalcophile elements as removal in both low and high inoculum trials was comparable under reducing conditions (Section 5.1.4.1).

SPB growth was not inhibited at colder temperatures, although a few differences in abundance and types of SPB was observed (Figure 5-43). While the cold temperature Trial 5 was generally lower in percentages, the inferred abundance in the water at Week 22 was similar to both 10 g of soil room temperature Trials 2 and 6. Trial 5 substrate had lower SPB abundance at take down than Trial 6 and Trial 2 substrate, however, the abundance was substantially higher than that in control Trial 7.

Additionally, there was no impact to SPB with the high 10X metals salts concentrations of COPIs in Trial 6, as evidenced by the similarity in the SPB population between Trial 2 and Trial 6. The SPB population and consequently sulphide-production and removal of chalcophile metals is therefore not expected to be impacted by COPI concentrations within this range in the pit lake.

Figure 5-43: Sulphide-producing Bacteria associated with Substrate and Water in the Trials

The primary y-axis provides the percentage of the bacterial population (relative abundance) that corresponds to sulphide-producing bacteria through the reduction of sulphate, sulphite, thiosulphate, and sulphur. Organisms are classified to the genus or family level (f). The secondary y-axis provides the inferred abundance of SPB in the substrate (per cm³) and water (per mL) samples. Quantities of bacteria in the initial RC (rock composite) sample were below the limit of analysis. Vertical lines are used to separate sample types. Samples are labelled according to the Trial number that the sample was collected for substrate and water as well as the stage and week of sample collection. Sample labels are: S1W22 (Stage 1 Week 22 [mid point]), S1W34 (Stage 1 Week 34[end point Stage 1], and S2W12 (Stage 2 Week 12 [end point Stage 2]). Initial samples are: RC (rock composite), SI (soil inoculum), and TW (tap water room temperature trial).

5.6.2 SELENIUM-REDUCING AND URANIUM-REDUCING BACTERIA

Selenium-reducing bacteria (SeRB) were present in all sample types (i.e., water and substrate) tested during and at the end of the trials (Appendix C). Substrate samples from trials with carbon dosing (Trials 2 to 6) had higher diversity than the control Trial 7 with no carbon dosing, suggesting the lack of carbon prevented the development of a diverse SeRB population. There was a higher abundance and percentage of SeRB in the cold temperature Trial 5 (both water and substrate), compared to the other trials with a similar soil inoculum (Trial 2 and 6). Similarly, there was no impact to SeRB with the high 10X metals salts concentrations of COPIs in Trial 6. The microbiology results therefore support that microbially mediated selenium reduction can occur at the range of temperatures tested herein, and a diverse SeRB population can be promoted to establish through the addition of carbon.

Uranium-reducing bacteria (URB) were also present in all sample types (i.e., water and substrate) tested during and at the end of the trials (Appendix C). Similar to other beneficial bacterial populations, the addition of carbon promoted a higher diversity of URB (trials with carbon compared to control Trial 7), and the establishment was not inhibited by colder temperatures or higher concentrations of COPIs. The microbiology results therefore support the observation of microbially catalyzed uranium reduction in the trials through the addition of carbon.

6. SUMMARY OF KEY FINDINGS

Stage 1 of the *in situ* treatment trials examined COPI removal under reducing conditions stimulated by the addition of organic carbon. The primary observations of these experiments are summarized as:

- A second carbon dose during week 11 resulted in reducing conditions and generally the lowest concentrations of antimony, cadmium, copper, lead, selenium, uranium, and zinc concentrations by the end of Week 14;
- The addition of 10 kg of soil (Trials 3 and 4) resulted in comparable removal to 10 g of soil (Trials 1 and 2) for most COPIs during reducing conditions, however, following re-oxidation, sustained removal via sorption on the larger soil mass was observed for these experiments;
- At lower temperatures (5°C), reducing conditions were slower to be established, due to slower microbial metabolism at the colder temperatures, which was reflected in the slower decrease of COPIs compared to those trials operating at room temperature;
- COPI removal was lower if trials became carbon limited, which resulted in lowered treatment performance in Trial 1 and 6;
- Percent removal of COPIs assumed in the ABM Lake water quality model (AEG, 2018) was supported by the *in situ* treatment trials, particularly for Trial 2 which did not contain the 10 kg of soil; and
- The *in situ* trials demonstrated establishment of a diverse population of sulphide-producing, selenium-reducing, and uranium-reducing bacteria with the addition of carbon, supporting the observation of microbially catalyzed COPI removal in the trials. Establishment was not inhibited by colder temperature or by higher COPI concentrations that were tested.

Stage 2 of the *in situ* treatment trials examined COPI (particularly arsenic) removal following ferric iron addition under both oxidizing and reducing conditions. These experiments indicated:

- Addition of ferric iron resulted in a maximum removal of approximately 40% to 65% of arsenic;
- The higher iron to arsenic ratio (20:1) improved removal of dissolved arsenic, suggesting that overall removal of total arsenic may be further improved upon extended settling time;
- At lower temperatures (5°C), abiotic processes were less affected by temperature as shown by comparable arsenic removal through sorption to iron (oxyhydr)oxides in Trials 1 and 5;
- Although the order of ferric and carbon dosing did not appear to influence the maximum total arsenic removal observed, greater removal was observed at the end of Trial 5 for dissolved arsenic, which received ferric iron first under oxidizing conditions before transitioning to reducing conditions following carbon amendment;
- Additional arsenic sequestration in reducing systems likely occurs via incorporation into iron sulphides in the presence of iron, which can also polish arsenic concentrations as the system begins to re-oxidize, perhaps by sorption on iron (oxyhydr)oxides that start to re-precipitate; and
- Ferric addition under oxidizing conditions resulted in no to minor removal of other COPIs; however, subsequent transition to reducing conditions resulted in improved removal of cadmium and copper at the highest iron dose.

Bench-scale iron addition trials were conducted to evaluate arsenic removal with ferric addition under conditions of complete mixing, to assess the maximum arsenic removal that may be realized. These experiments showed that:

- The addition of ferric iron to a well mixed bench-scale experiment achieved greater arsenic removal on a shorter time scale compared to the *in situ* treatment trials; and
- After 144 hours, up to 90% of total arsenic removal was achieved with a Fe:As mass ratio of 20:1 compared to approximately 50% removal with a Fe:As mass ratio of 10:1.

7. CONCEPTUAL IMPLEMENTATION OF *IN SITU* TREATMENT IN ABM LAKE

ABM Lake is expected to take approximately 15 years to form before it begins to discharge to Geona Creek. Water quality monitoring of the ABM Lake will occur as it fills to monitor its chemistry, help direct the optimal location and timing of *in situ* treatment, and determine whether additional treatment events are required to maintain low COPI concentrations. COPI concentrations will peak in the first year of flooding as the more reactive, metal-leaching rock facies are located in the lower portion of the ABM pit which release their accumulated soluble load to the small volume of water in the pit (AEG, 2018). COPI concentrations then decline over the following year due to dilution before stabilizing or rising slowly as the pit fills (AEG, 2018).

7.1 FERRIC IRON AMENDMENT

The Stage 2 and Stage 3 *in situ* experiments suggest that ferric iron dosing is effective at removing arsenic from the water column while mixing is important to ensure optimal arsenic removal (i.e., contact with the precipitating ferric hydroxide). Based on the Stage 3 data, an iron to arsenic ratio of 20:1 is recommended to optimize arsenic removal. If required, ferric iron addition in the early stages (e.g., Year 5 or earlier) of the ABM Lake formation is recommended given that:

- Arsenic concentrations are predicted to peak in the first few years of filling;
- The nascent ABM Lake will be better mixed during this early stage in its formation; and
- The smaller water volume present in the pit will result in lower reagent requirements and lower cost.

Based on the ABM Lake volume at Year 5 (11.408 million m³) and an arsenic concentration of 0.058 mg/L, approximately 18.9 tonnes of ferric iron are required to achieve a 20:1 iron to arsenic ratio in the lake. Commercially available liquid ferric sulphate has a ferric iron content of approximately 13% and specific gravity of 1.6. Therefore, 18.9 tonnes of ferric sulphate equates to approximately 91 m³ of commercial ferric sulphate solution. This material can be shipped to site in 275 gallon (1 m³) totes (i.e., 91 totes) and added to the ABM pit by direct addition to the inflowing Fault Creek water. This would facilitate treatment of the Krakatoa zone portion of ABM Lake. Addition to the remainder of ABM Lake may be performed using water cannons situated around the pit. A water distribution system comprising cannons, pumps, and piping would pump water from ABM Lake, and spray it back with ferric amendment, dependent on safe access to locations close enough to pump water from the pit to feed the water cannons. The iron (oxyhydr)oxide precipitates that form will scavenge dissolved arsenic and settle out of the water column following the cessation of pumping.

Water quality monitoring before and after the iron addition will assess the efficacy of the treatment and subsequent regular monitoring will determine whether any additional arsenic removal may be required prior to discharge of the lake to Geona Creek. Addition of ferric reagent in the later stages of filling will need to be balanced against the potential exceedance of WQO for the counter-anion in the ferric reagent (e.g., sulphate, chloride, nitrate), although the sulphate added is likely to be negligible relative to that already present in the lake. If alternative ferric iron sources are required to minimize sulphate addition, use of ferric nitrate may be preferred for any ferric addition required in the later stages of pit filling since the nitrate can be subsequently removed by a follow-up carbon injection.

7.2 ORGANIC CARBON AMENDMENT

Glycerol was used in the *in situ* trials as an electron dense source of carbon that is readily utilized by the microorganisms which facilitate COPI removal. Glycerol also has safety and logistical advantages over other potential sources of organic

carbon. For example, glycerol does not have flammability issues associated with more volatile alcohols (e.g., methanol, ethanol) and is less viscous than molasses, allowing for safer and easier application at the Kudz Ze Kayah Site.

Glycerol will be added later in the lake filling period in order to (i) allow a larger volume of water to form, which provides a greater barrier to oxygen ingress at depth once reducing conditions are established; (ii) harness the ice cover that will form on the larger water body over winter, which will also act as a barrier to oxidation by atmospheric oxygen; and (iii) utilize the iron added from the ferric treatment to assist in COPI removal and longer term sequestration associated with iron sulphide formation. Carbon addition maybe be considered around Years 8 to 10 after the start of ABM Lake formation, which would allow for significant time to monitor COPI removal and allow for any contingency measures (e.g., additional carbon addition) to be enacted if needed.

Based on the ABM Lake volume at Year 8 (18.147 million m³), approximately 1,500 m³ of 100% glycerol is required to match the glycerol dose used in the Stage 2 Trials that resulted in marked COPI removal (13 mL in approximately 160 L water). This would require 24 B-train tankers, assuming a volume of 64 m³ for a standard B-train. Glycerol may be deposited at site in a large storage vessel at one or two storage facilities depending on the selected injection location(s) to the nascent ABM Lake. Glycerol can be added by both direct addition to the discharging Fault Creek water and via a water distribution system similar constructed of water cannons, pumps, and piping to stimulate the development of reducing conditions. Enough organic carbon will be added to consume dissolved oxygen, nitrate and nitrite, and cause the partial conversion of some dissolved sulphate to sulphide. Under such reducing conditions, elements such as selenium and uranium are largely transformed to less soluble forms (e.g., elemental selenium and uraninite phases). Chalcophile elements such as cadmium, zinc, copper, antimony, and lead will precipitate as poorly soluble sulphide minerals. The insoluble phases formed will settle to the lake bottom for long-term storage. Reactive iron sulphide minerals will also form during treatment, which will help scavenge some COPI via co-precipitation and also act as a sacrificial anode to maintain the reduced COPI in their stable precipitated forms in the lake sediment.

Treatment will be initiated in late summer/early fall at a time when microbial respiration rates are highest. Continuous injection of glycerol to the lake, with recirculation mixing, will occur over a period of one to two months, sufficient to distribute glycerol throughout the lake. As reducing conditions develop over the subsequent months, the formation of an ice layer over the lake will help limit the ingress of oxygen and prolong the period of time that the lake will remain reducing, thus maximizing COPI removal. Much longer sustained periods of reducing conditions are anticipated for the full scale implementation than observed in pilot-scale barrel trials due to the greater water column depth and associated slower oxygen ingress and the ice cover barrier to the atmosphere. Water quality sampling will continue following the carbon injection event and will include the collection of samples at strategic depths in the water column to evaluate the development of any stratification, since the presence of an anoxic hypolimnion (lower layer of water in a stratified lake) at depth will further assist in the preservation of the reduced COPI in their stable precipitated forms.

Remarks:

Maxxam Analytics' laboratories are accredited to ISO/IEC 17025:2005 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing. Maxxam is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by Maxxam, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) This test was performed by Maxxam Vancouver

(2) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).

Sampler Initials: KP

QC Batch	Parameter	Date	Matrix Spike		Spiked Blank		Method Blank		RPD	
			% Recovery	QC Limits	% Recovery	QC Limits	Value	UNITS	Value (%)	QC Limits
9189471	Total Zirconium (Zr)	2018/10/18	96	80 - 120	103	80 - 120	<0.00010	mg/L	NC	20

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference $\leq 2 \times \text{RDL}$).

Report Date: 2018/12/11
Report #: R2662701
Version: 1 - Partial

CERTIFICATE OF ANALYSIS – PARTIAL RESULTS

MAXXAM JOB #: B8A3309

Received: 2018/11/23, 13:04

Sample Matrix: Soil
Samples Received: 1

Analyses	Quantity	Date Extracted	Date Analyzed	Laboratory Method	Analytical Method
Sublet (Inorganics) (1)	1	N/A	2018/12/10		

Remarks:

Maxxam Analytics' laboratories are accredited to ISO/IEC 17025:2005 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing. Maxxam is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by Maxxam, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	1.0°C
-----------	-------

Revised Report V2 (2019/01/08): Report re-issued to include Nitrate parameter results for all samples. DC6

LOW LEVEL DISSOLVED METALS IN WATER (WATER) Comments

Matrix Spike Elements by ICPMS Low Level (dissolved): RDL raised due to concentration over linear range, sample dilution required.

Results relate only to the items tested.

QC Batch	Parameter	Date	Matrix Spike		Spiked Blank		Method Blank		RPD	
			% Recovery	QC Limits	% Recovery	QC Limits	Value	UNITS	Value (%)	QC Limits
9279537	Dissolved Chloride (Cl)	2018/12/29			103	80 - 120	<0.50	mg/L		
9279539	Dissolved Chloride (Cl)	2018/12/29			103	80 - 120	<0.50	mg/L		
9279541	Dissolved Sulphate (SO4)	2018/12/29	NC	80 - 120	99	80 - 120	0.88, RDL=0.50	mg/L	1.2	20
9280231	Dissolved Sulphate (SO4)	2018/12/31	NC	80 - 120	96	80 - 120	0.57, RDL=0.50	mg/L	5.8	20
9280742	Fluoride (F)	2019/01/02	NC	80 - 120	100	80 - 120	<0.010	mg/L	0	20

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference $\leq 2 \times$ RDL).

Remarks:

Maxxam Analytics' laboratories are accredited to ISO/IEC 17025:2005 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing. Maxxam is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by Maxxam, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) This test was performed by Maxxam Vancouver

(2) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	13.7°C
-----------	--------

Sample VA8944 [TRIAL #3] : Sample analyzed for digested low level metals due to sediment in sample. This results in an increased reportable detection limit for Al B Ba Bi Cr Co Cu Fe Mn Ni P Pb Sb Si Ti U V and Zn.

Sample VA8945 [TRIAL #4] : Sample analyzed for digested low level metals due to sediment in sample. This results in an increased reportable detection limit for Al B Ba Bi Cr Co Cu Fe Mn Ni P Pb Sb Si Ti U V and Zn.

Sample VA8946 [TRIAL #5] : Sample analyzed for digested low level metals due to sediment in sample. This results in an increased reportable detection limit for Al B Ba Bi Cr Co Cu Fe Mn Ni P Pb Sb Si Ti U V and Zn.

Sample VA8947 [TRIAL #6] : Sample analyzed for digested low level metals due to sediment in sample. This results in an increased reportable detection limit for Al B Ba Bi Cr Co Cu Fe Mn Ni P Pb Sb Si Ti U V and Zn.

Sample VA8948 [TRIAL #7] : Sample analyzed for digested low level metals due to sediment in sample. This results in an increased reportable detection limit for Al B Ba Bi Cr Co Cu Fe Mn Ni P Pb Sb Si Ti U V and Zn.

Sample VA8949 [TRIAL #8] : Sample analyzed for digested low level metals due to sediment in sample. This results in an increased reportable detection limit for Al B Ba Bi Cr Co Cu Fe Mn Ni P Pb Sb Si Ti U V and Zn.

Results relate only to the items tested.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

(1) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.

Remarks:

Maxxam Analytics' laboratories are accredited to ISO/IEC 17025:2005 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing. Maxxam is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

CERTIFICATE OF ANALYSIS

MAXXAM JOB #: B908267

Received: 2019/02/01, 14:07

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by Maxxam, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) This test was performed by Maxxam Vancouver

(2) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).

Encryption Key

Please direct all questions regarding this Certificate of Analysis to your Project Manager.

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	15.3°C
-----------	--------

Sample VE3807 [TRIAL #5] : Sample analyzed for digested low level metals due to sediment in sample. This results in an increased reportable detection limit for Al B Ba Bi Cr Co Cu Fe Mn Ni P Pb Sb Si Ti U V and Zn.

Sample VE3808 [TRIAL #6] : Sample analyzed for digested low level metals due to sediment in sample. This results in an increased reportable detection limit for Al B Ba Bi Cr Co Cu Fe Mn Ni P Pb Sb Si Ti U V and Zn.

Sample VE3809 [TRIAL #7] : Sample analyzed for digested low level metals due to sediment in sample. This results in an increased reportable detection limit for Al B Ba Bi Cr Co Cu Fe Mn Ni P Pb Sb Si Ti U V and Zn.

Results relate only to the items tested.

QUALITY ASSURANCE REPORT(CONT'D)

ALEXCO ENVIRONMENTAL GROUP INC.
Client Project #: BMC-18-02
Site Location: KUDZ ZE KAYAH

QC Batch	Parameter	Date	Matrix Spike		Spiked Blank		Method Blank		RPD	
			% Recovery	QC Limits	% Recovery	QC Limits	Value	UNITS	Value (%)	QC Limits
9315847	Dissolved Chloride (Cl)	2019/02/05			103	80 - 120	<0.50	mg/L		

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference $\leq 2 \times \text{RDL}$).

VALIDATION SIGNATURE PAGE

The analytical data and all QC contained in this report were reviewed and validated by the following individual(s).

David Huang, M.Sc., P.Chem., QP, Scientific Services Manager

Maxxam has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per section 5.10.2 of ISO/IEC 17025:2005(E), signing the reports. For Service Group specific validation please refer to the Validation Signature Page.

Sulphate - Low Level (1)	2	N/A	2019/02/25	BBY6SOP-00017	SM 22 4500-SO42- E m

Remarks:

Maxxam Analytics' laboratories are accredited to ISO/IEC 17025:2005 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing. Maxxam is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by Maxxam, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) This test was performed by Maxxam Vancouver

QUALITY ASSURANCE REPORT(CONT'D)

ALEXCO ENVIRONMENTAL GROUP INC.
Client Project #: BMC-18-02
Site Location: KUDZ ZE KAYAH

QC Batch	Parameter	Date	Matrix Spike		Spiked Blank		Method Blank		RPD	
			% Recovery	QC Limits	% Recovery	QC Limits	Value	UNITS	Value (%)	QC Limits
9332711	Dissolved Sulphate (SO4)	2019/02/25			96	80 - 120	<0.50	mg/L		

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference $\leq 2 \times \text{RDL}$).

Remarks:

Maxxam Analytics' laboratories are accredited to ISO/IEC 17025:2005 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing. Maxxam is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by Maxxam, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) This test was performed by Maxxam Vancouver

CERTIFICATE OF ANALYSIS

MAXXAM JOB #: B917661

Received: 2019/03/11, 14:48

(2) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).

Encryption Key

Please direct all questions regarding this Certificate of Analysis to your Project Manager.

Diana Cruz, Project Manager

QUALITY ASSURANCE REPORT(CONT'D)

ALEXCO ENVIRONMENTAL GROUP INC.
Client Project #: BMC-18-02
Site Location: KUDZ ZE KAYAH

QC Batch	Parameter	Date	Matrix Spike		Spiked Blank		Method Blank		RPD	
			% Recovery	QC Limits	% Recovery	QC Limits	Value	UNITS	Value (%)	QC Limits
9356555	Dissolved Sulphate (SO4)	2019/03/20	NC	80 - 120	98	80 - 120	0.52, RDL=0.50	mg/L		
Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement. Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference. Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy. Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination. NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration) NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

Good morning,

Could you please begin analysis on these samples today (March 18), with a 2-day TAT?

Thanks!

Christie Brizinski, dip.BT | Technologist II

Good Afternoon Christie,

I have notified our Burnaby Team.

We will Hold all these 8 Samples for Project BMC-18-02 till further notice .

Please let us know if you require anything else .

Thanks,

Sincerely,

Jasbirjit Kaur (Jas)

Hi Diana,

We submitted total/dissolved metals and sulphate samples yesterday, could you please
hold the analysis on those until further notice?

Thank you!

Remarks:

Maxxam Analytics' laboratories are accredited to ISO/IEC 17025:2005 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

CERTIFICATE OF ANALYSIS

MAXXAM JOB #: B921856

Received: 2019/03/26, 09:43

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing. Maxxam is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by Maxxam, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) This test was performed by Maxxam Vancouver

(2) DOC present in the sample should be considered as non-purgeable DOC. Dissolved > Total Imbalance: When applicable, Dissolved and Total results were reviewed and data quality meets acceptable levels unless otherwise noted.

(3) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).

Encryption Key

Please direct all questions regarding this Certificate of Analysis to your Project Manager.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

(1) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.

VALIDATION SIGNATURE PAGE

The analytical data and all QC contained in this report were reviewed and validated by the following individual(s).

David Huang, M.Sc., P.Chem., QP, Scientific Services Manager

Ghayasuddin Khan, M.Sc., P.Chem., QP, Scientific Specialist, Inorganics

Maxxam has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per section 5.10.2 of ISO/IEC 17025:2005(E), signing the reports. For Service Group specific validation please refer to the Validation Signature Page.

Remarks:

Maxxam Analytics' laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing. Maxxam is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by Maxxam, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) This test was performed by Maxxam Vancouver

(2) DOC present in the sample should be considered as non-purgeable DOC. Dissolved > Total Imbalance: When applicable, Dissolved and Total results were reviewed and data quality meets acceptable levels unless otherwise noted.

(3) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	2.7°C
-----------	-------

Sample VM5759 [TRIAL #1] : Sample analyzed for digested low level metals due to sediment in sample. This results in an increased reportable detection limit for Al B Ba Bi Cr Co Cu Fe Mn Ni P Pb Sb Si Ti U V and Zn.

Sample VM5760 [TRIAL #2] : Sample analyzed for digested low level metals due to sediment in sample. This results in an increased reportable detection limit for Al B Ba Bi Cr Co Cu Fe Mn Ni P Pb Sb Si Ti U V and Zn.

Sample VM5761 [TRIAL #3] : Sample analyzed for digested low level metals due to sediment in sample. This results in an increased reportable detection limit for Al B Ba Bi Cr Co Cu Fe Mn Ni P Pb Sb Si Ti U V and Zn.

Sample VM5762 [TRIAL #4] : Sample analyzed for digested low level metals due to sediment in sample. This results in an increased reportable detection limit for Al B Ba Bi Cr Co Cu Fe Mn Ni P Pb Sb Si Ti U V and Zn.

Sample VM5763 [TRIAL #5] : Sample analyzed for digested low level metals due to sediment in sample. This results in an increased reportable detection limit for Al B Ba Bi Cr Co Cu Fe Mn Ni P Pb Sb Si Ti U V and Zn.

Sample VM5766 [TRIAL #8] : Sample analyzed for digested low level metals due to sediment in sample. This results in an increased reportable detection limit for Al B Ba Bi Cr Co Cu Fe Mn Ni P Pb Sb Si Ti U V and Zn.

Sample VM5761, Elements by ICPMS Low Level (dissolved): Test repeated.

Sample VM5766, Elements by ICPMS Low Level (dissolved): Test repeated.

Results relate only to the items tested.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

(1) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.

VALIDATION SIGNATURE PAGE

The analytical data and all QC contained in this report were reviewed and validated by the following individual(s).

Ghayasuddin Khan, M.Sc., P.Chem., QP, Scientific Specialist, Inorganics

Harry (Peng) Liang, Senior Analyst

Maxxam has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per section 5.10.2 of ISO/IEC 17025:2005(E), signing the reports. For Service Group specific validation please refer to the Validation Signature Page.

Remarks:

Maxxam Analytics' laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing. Maxxam is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by Maxxam, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) This test was performed by Maxxam Vancouver

(2) DOC present in the sample should be considered as non-purgeable DOC. Dissolved > Total Imbalance: When applicable, Dissolved and Total results were reviewed and data quality meets acceptable levels unless otherwise noted.

(3) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	11.7°C
Package 2	15.0°C

Version 2: Report reissued to revise the sample IDs as per COC 2019/05/08

Sample VO3870, Elements by ICPMS Low Level (dissolved): Test repeated.

Sample VO3872, Elements by ICPMS Low Level (dissolved): Test repeated.

Sample VO3873, Elements by ICPMS Low Level (dissolved): Test repeated.

Results relate only to the items tested.

QUALITY ASSURANCE REPORT(CONT'D)

ALEXCO ENVIRONMENTAL GROUP INC.
Client Project #: BMC-18-02
Site Location: KUDZ ZE KAYAH

QC Batch	Parameter	Date	Matrix Spike		Spiked Blank		Method Blank		RPD	
			% Recovery	QC Limits	% Recovery	QC Limits	Value	UNITS	Value (%)	QC Limits
9407751	Dissolved Chloride (Cl)	2019/05/07			104	80 - 120	<0.50	mg/L		
9407755	Dissolved Sulphate (SO4)	2019/05/07			98	80 - 120	<0.50	mg/L		

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference $\leq 2 \times \text{RDL}$).

(1) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.

(2) Method blank result is $< 2 \times \text{RDL}$.

VALIDATION SIGNATURE PAGE

The analytical data and all QC contained in this report were reviewed and validated by the following individual(s).

Harry (Peng) Liang, Senior Analyst

Rob Reinert, B.Sc., Scientific Spécialist

Maxxam has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per section 5.10.2 of ISO/IEC 17025:2005(E), signing the reports. For Service Group specific validation please refer to the Validation Signature Page.

Remarks:

Maxxam Analytics' laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

CERTIFICATE OF ANALYSIS

MAXXAM JOB #: B934243

Received: 2019/05/07, 14:34

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing. Maxxam is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by Maxxam, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) This test was performed by Maxxam Vancouver

(2) DOC present in the sample should be considered as non-purgeable DOC. Dissolved > Total Imbalance: When applicable, Dissolved and Total results were reviewed and data quality meets acceptable levels unless otherwise noted.

(3) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).

Encryption Key

Please direct all questions regarding this Certificate of Analysis to your Project Manager.

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	11.0°C
Package 2	12.3°C

Sample VQ3758, Elements by ICPMS Low Level (dissolved): Test repeated.

Sample VQ3760, Elements by ICPMS Low Level (dissolved): Test repeated.

Sample VQ3761, Elements by ICPMS Low Level (dissolved): Test repeated.

Sample VQ3764, Elements by ICPMS Low Level (dissolved): Test repeated.

Results relate only to the items tested.

9415372	Dissolved Chloride (Cl)	2019/05/13	NC	80 - 120	103	80 - 120	<0.50	mg/L	1.7	20
9415373	Dissolved Sulphate (SO ₄)	2019/05/13	NC	80 - 120	102	95 - 109	<0.50	mg/L	1.1	20
9420789	Dissolved Thallium (Tl)	2019/05/16			101	80 - 120	<0.0000020	mg/L		
9420789	Dissolved Vanadium (V)	2019/05/16			99	80 - 120	<0.00020	mg/L		
9420789	Dissolved Zirconium (Zr)	2019/05/16			99	80 - 120	<0.00010	mg/L		

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

(1) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.

(2) Method blank exceeds acceptance limits for As- 2X RDL acceptable for low level metals determination.

(3) Method blank exceeds acceptance limits for Tl- 2X RDL acceptable for low level metals determination.

(4) Method blank exceeds acceptance limits for U- 2X RDL acceptable for low level metals determination.

VALIDATION SIGNATURE PAGE

The analytical data and all QC contained in this report were reviewed and validated by the following individual(s).

David Huang, M.Sc., P.Chem., QP, Scientific Services Manager

Harry (Peng) Liang, Senior Analyst

Maxxam has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per section 5.10.2 of ISO/IEC 17025:2005(E), signing the reports. For Service Group specific validation please refer to the Validation Signature Page.

Remarks:

Maxxam Analytics' laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

CERTIFICATE OF ANALYSIS

MAXXAM JOB #: B938509

Received: 2019/05/21, 15:00

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing. Maxxam is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by Maxxam, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) DOC present in the sample should be considered as non-purgeable DOC. Dissolved > Total Imbalance: When applicable, Dissolved and Total results were reviewed and data quality meets acceptable levels unless otherwise noted.

(2) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).

Encryption Key

Please direct all questions regarding this Certificate of Analysis to your Project Manager.

RDL = Reportable Detection Limit									
(1) Duplicate exceeds acceptance criteria due to sample non homogeneity. Unable to reanalyze due to insufficient sample.									
(2) Detection limits raised due to dilution to bring analyte within the calibrated range.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

(1) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.

VALIDATION SIGNATURE PAGE

The analytical data and all QC contained in this report were reviewed and validated by the following individual(s).

Ghayasuddin Khan, M.Sc., P.Chem., QP, Scientific Specialist, Inorganics

Harry (Peng) Liang, Senior Analyst

Maxxam has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per section 5.10.2 of ISO/IEC 17025:2005(E), signing the reports. For Service Group specific validation please refer to the Validation Signature Page.

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless

CERTIFICATE OF ANALYSIS

BV LABS JOB #: B943649

Received: 2019/06/05, 13:11

indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) This test was performed by BV Labs Vancouver

(2) DOC present in the sample should be considered as non-purgeable DOC. Dissolved > Total Imbalance: When applicable, Dissolved and Total results were reviewed and data quality meets acceptable levels unless otherwise noted.

(3) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).

Encryption Key

Please direct all questions regarding this Certificate of Analysis to your Project Manager.

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	13.0°C
-----------	--------

Sample VV0841 [TRIAL #1] : Nitrogen (Nitrite - Nitrate) Low Level completed within 48h after laboratory receipt to a maximum of five days from sampling. Data are satisfactory for compliance purposes.

Sample VV0842 [TRIAL #2] : Nitrogen (Nitrite - Nitrate) Low Level completed within 48h after laboratory receipt to a maximum of five days from sampling. Data are satisfactory for compliance purposes.

Sample VV0843 [TRIAL #3] : Nitrogen (Nitrite - Nitrate) Low Level completed within 48h after laboratory receipt to a maximum of five days from sampling. Data are satisfactory for compliance purposes.

Sample VV0844 [TRIAL #4] : Nitrogen (Nitrite - Nitrate) Low Level completed within 48h after laboratory receipt to a maximum of five days from sampling. Data are satisfactory for compliance purposes.

Sample VV0845 [TRIAL #5] : Nitrogen (Nitrite - Nitrate) Low Level completed within 48h after laboratory receipt to a maximum of five days from sampling. Data are satisfactory for compliance purposes.

Sample VV0846 [TRIAL #6] : Nitrogen (Nitrite - Nitrate) Low Level completed within 48h after laboratory receipt to a maximum of five days from sampling. Data are satisfactory for compliance purposes.

Sample VV0847 [TRIAL #7] : Nitrogen (Nitrite - Nitrate) Low Level completed within 48h after laboratory receipt to a maximum of five days from sampling. Data are satisfactory for compliance purposes.

Sample VV0848 [TRIAL #8] : Nitrogen (Nitrite - Nitrate) Low Level completed within 48h after laboratory receipt to a maximum of five days from sampling. Data are satisfactory for compliance purposes.

Results relate only to the items tested.

9465314	Acidity (pH 8.3)	2019/06/13			101	80 - 120	<1.0	mg/L		

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

VALIDATION SIGNATURE PAGE

The analytical data and all QC contained in this report were reviewed and validated by the following individual(s).

David Huang, M.Sc., P.Chem., QP, Scientific Services Manager

Ghayasuddin Khan, M.Sc., P.Chem., QP, Scientific Specialist, Inorganics

Harry (Peng) Liang, Senior Analyst

BV Labs has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per section 5.10.2 of ISO/IEC 17025:2005(E), signing the reports. For Service Group specific validation please refer to the Validation Signature Page.

CERTIFICATE OF ANALYSIS

BV LABS JOB #: B948046

Received: 2019/06/18, 13:11

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) This test was performed by BV Labs Vancouver

(2) DOC present in the sample should be considered as non-purgeable DOC. Dissolved > Total Imbalance: When applicable, Dissolved and Total results were reviewed and data quality meets acceptable levels unless otherwise noted.

(3) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).

Encryption Key

Please direct all questions regarding this Certificate of Analysis to your Project Manager.

=====

BV Labs has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per section 5.10.2 of ISO/IEC 17025:2005(E), signing the reports. For Service Group specific validation please refer to the Validation Signature Page.

RDL = Reportable Detection Limit

N/A = Not Applicable

(1) Detection limits raised due to dilution to bring analyte within the calibrated range.

(2) Matrix spike exceeds acceptance limits for nh4, probable matrix interference.

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	12.7°C
-----------	--------

Sample VX6016 [TRAIL #1] : Sample analyzed for digested low level metals due to sediment in sample. This results in an increased reportable detection limit for Al B Ba Bi Cr Co Cu Fe Mn Ni P Pb Sb Si Ti U V and Zn.

Sample VX6017 [TRAIL #2] : Sample analyzed for digested low level metals due to sediment in sample. This results in an increased reportable detection limit for Al B Ba Bi Cr Co Cu Fe Mn Ni P Pb Sb Si Ti U V and Zn.

Sample VX6018 [TRAIL #3] : Sample analyzed for digested low level metals due to sediment in sample. This results in an increased reportable detection limit for Al B Ba Bi Cr Co Cu Fe Mn Ni P Pb Sb Si Ti U V and Zn.

Sample VX6019 [TRAIL #4] : Sample analyzed for digested low level metals due to sediment in sample. This results in an increased reportable detection limit for Al B Ba Bi Cr Co Cu Fe Mn Ni P Pb Sb Si Ti U V and Zn.

Sample VX6020 [TRAIL #5] : Sample analyzed for digested low level metals due to sediment in sample. This results in an increased reportable detection limit for Al B Ba Bi Cr Co Cu Fe Mn Ni P Pb Sb Si Ti U V and Zn.

LL TOTAL METALS (DIGESTED) IN WATER Comments

Matrix Spike Elements by ICPMS Digested LL (total): RDL raised due to concentration over linear range, sample dilution required.

Sample VX6016, Elements by ICPMS Low Level (dissolved): Test repeated.

Sample VX6017, Elements by ICPMS Low Level (dissolved): Test repeated.

Sample VX6018, Elements by ICPMS Low Level (dissolved): Test repeated.

Results relate only to the items tested.

QUALITY ASSURANCE REPORT(CONT'D)

ALEXCO ENVIRONMENTAL GROUP INC.

Client Project #: BMC-18-02

Site Location: KUDZ ZE KAYAH

QC Batch	Parameter	Date	Matrix Spike		Spiked Blank		Method Blank		RPD	
			% Recovery	QC Limits	% Recovery	QC Limits	Value	UNITS	Value (%)	QC Limits
9480454	Total Thallium (Tl)	2019/06/25	95	80 - 120	100	80 - 120	<0.0000020	mg/L	14	20
9480454	Total Tin (Sn)	2019/06/25	99	80 - 120	101	80 - 120	<0.00020	mg/L	NC	20
9480454	Total Titanium (Ti)	2019/06/25	134 (1)	80 - 120	101	80 - 120	<0.0020	mg/L	NC	20
9480454	Total Uranium (U)	2019/06/25	101	80 - 120	101	80 - 120	<0.0000050	mg/L	1.1	20
9480454	Total Vanadium (V)	2019/06/25	103	80 - 120	100	80 - 120	<0.00020	mg/L	NC	20
9480454	Total Zinc (Zn)	2019/06/25	99	80 - 120	100	80 - 120	<0.0010	mg/L	NC	20
9480454	Total Zirconium (Zr)	2019/06/25	NC	80 - 120	101	80 - 120	<0.00010	mg/L	12	20
9482465	Dissolved Aluminum (Al)	2019/06/25			101	80 - 120	<0.00050	mg/L		

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference $\leq 2 \times$ RDL).

(1) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.

(2) Method blank exceeds acceptance limits for As- $2 \times$ RDL acceptable for low level metals determination.

VALIDATION SIGNATURE PAGE

The analytical data and all QC contained in this report were reviewed and validated by the following individual(s).

David Huang, M.Sc., P.Chem., QP, Scientific Services Manager

Ghayasuddin Khan, M.Sc., P.Chem., QP, Scientific Specialist, Inorganics

Harry (Peng) Liang, Senior Analyst

BV Labs has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per section 5.10.2 of ISO/IEC 17025:2005(E), signing the reports. For Service Group specific validation please refer to the Validation Signature Page.

CERTIFICATE OF ANALYSIS

BV LABS JOB #: B953424

Received: 2019/07/03, 14:15

accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) This test was performed by BV Labs Vancouver

(2) DOC present in the sample should be considered as non-purgeable DOC. Dissolved > Total Imbalance: When applicable, Dissolved and Total results were reviewed and data quality meets acceptable levels unless otherwise noted.

(3) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).

Encryption Key

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	16.0°C
-----------	--------

Sample WA3865, Elements by ICPMS Low Level (dissolved): Test repeated.

Sample WA3865, Elements by ICPMS Low Level (total): Test repeated.

Results relate only to the items tested.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

(1) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.

(2) Method blank <2X RDL.

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been

CERTIFICATE OF ANALYSIS

BV LABS JOB #: B957621

Received: 2019/07/16, 15:00

accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) This test was performed by BV Labs Vancouver

(2) DOC present in the sample should be considered as non-purgeable DOC. Dissolved > Total Imbalance: When applicable, Dissolved and Total results were reviewed and data quality meets acceptable levels unless otherwise noted.

(3) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).

Encryption Key

Please direct all questions regarding this Certificate of Analysis to your Project Manager.

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	11.7°C
-----------	--------

Sample WC6405 [TRIAL # 1] : Sample was analyzed past method specified hold time for Orthophosphate by Konelab (low level). Exceedance of hold time increases the uncertainty of test results but does not necessarily imply that results are compromised. Sample was analyzed past method specified hold time for Nitrogen (Nitrite - Nitrate) Low Level.

Sample WC6406 [TRIAL # 2] : Sample was analyzed past method specified hold time for Orthophosphate by Konelab (low level). Exceedance of hold time increases the uncertainty of test results but does not necessarily imply that results are compromised. Sample was analyzed past method specified hold time for Nitrogen (Nitrite - Nitrate) Low Level.

Sample WC6407 [TRIAL # 3] : Sample was analyzed past method specified hold time for Orthophosphate by Konelab (low level). Exceedance of hold time increases the uncertainty of test results but does not necessarily imply that results are compromised. Sample was analyzed past method specified hold time for Nitrogen (Nitrite - Nitrate) Low Level.

Sample WC6408 [TRIAL # 4] : Sample was analyzed past method specified hold time for Orthophosphate by Konelab (low level). Exceedance of hold time increases the uncertainty of test results but does not necessarily imply that results are compromised. Sample was analyzed past method specified hold time for Nitrogen (Nitrite - Nitrate) Low Level.

Sample WC6409 [TRIAL # 5] : Sample was analyzed past method specified hold time for Orthophosphate by Konelab (low level). Exceedance of hold time increases the uncertainty of test results but does not necessarily imply that results are compromised. Sample was analyzed past method specified hold time for Nitrogen (Nitrite - Nitrate) Low Level.

Sample WC6410 [TRIAL # 6] : Sample was analyzed past method specified hold time for Orthophosphate by Konelab (low level). Exceedance of hold time increases the uncertainty of test results but does not necessarily imply that results are compromised. Sample was analyzed past method specified hold time for Nitrogen (Nitrite - Nitrate) Low Level.

Sample WC6411 [TRIAL # 7] : Sample was analyzed past method specified hold time for Orthophosphate by Konelab (low level). Exceedance of hold time increases the uncertainty of test results but does not necessarily imply that results are compromised. Sample was analyzed past method specified hold time for Nitrogen (Nitrite - Nitrate) Low Level.

Sample WC6412 [TRIAL # 8] : Sample was analyzed past method specified hold time for Orthophosphate by Konelab (low level). Exceedance of hold time increases the uncertainty of test results but does not necessarily imply that results are compromised. Sample was analyzed past method specified hold time for Nitrogen (Nitrite - Nitrate) Low Level.

Sample WC6405, Elements by ICPMS Low Level (dissolved): Test repeated.

Sample WC6407, Elements by ICPMS Low Level (dissolved): Test repeated.

Sample WC6405, Elements by ICPMS Low Level (total): Test repeated.

Sample WC6407, Elements by ICPMS Low Level (total): Test repeated.

Results relate only to the items tested.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

(1) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.

VALIDATION SIGNATURE PAGE

The analytical data and all QC contained in this report were reviewed and validated by the following individual(s).

David Huang, M.Sc., P.Chem., QP, Scientific Services Manager

Harry (Peng) Liang, Senior Analyst

BV Labs has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per ISO/IEC 17025, signing the reports.
For Service Group specific validation please refer to the Validation Signature Page.

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been

Version: 1 - Final

CERTIFICATE OF ANALYSIS

BV LABS JOB #: B966389

Received: 2019/08/12, 14:00

accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) DOC present in the sample should be considered as non-purgeable DOC. Dissolved > Total Imbalance: When applicable, Dissolved and Total results were reviewed and data quality meets acceptable levels unless otherwise noted.

(2) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).

(3) The CCME method requires pH to be analysed within 15 minutes of sampling and therefore field analysis is required for compliance. All Laboratory pH analyses in this report are reported past the CCME holding time. Bureau Veritas Laboratories endeavours to analyze samples as soon as possible after receipt.

(4) Orthophosphate > Total Phosphorus Imbalance: When applicable, Orthophosphate, Total Phosphorus and dissolved Phosphorus results were reviewed and data quality meets acceptable levels unless otherwise noted.

Encryption Key

Please direct all questions regarding this Certificate of Analysis to your Project Manager.

QUALITY ASSURANCE REPORT(CONT'D)

ALEXCO ENVIRONMENTAL GROUP INC.

Client Project #: BMC-18-02

Site Location: KUDZ ZE KAYAH

QC Batch	Parameter	Date	Matrix Spike		Spiked Blank		Method Blank		RPD	
			% Recovery	QC Limits	% Recovery	QC Limits	Value	UNITS	Value (%)	QC Limits
9553295	Total Zinc (Zn)	2019/08/19	101	80 - 120	100	80 - 120	<0.00010	mg/L	4.9	20
9553295	Total Zirconium (Zr)	2019/08/19	92	80 - 120	102	80 - 120	<0.00010	mg/L	NC	20

N/A = Not Applicable

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference $\leq 2 \times \text{RDL}$).

(1) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.

CERTIFICATE OF ANALYSIS

BV LABS JOB #: B975888

Received: 2019/09/09, 13:15

by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

- (1) This test was performed by BV Labs Vancouver
- (2) DOC present in the sample should be considered as non-purgeable DOC. Dissolved > Total Imbalance: When applicable, Dissolved and Total results were reviewed and data quality meets acceptable levels unless otherwise noted.
- (3) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).
- (4) The CCME method requires pH to be analysed within 15 minutes of sampling and therefore field analysis is required for compliance. All Laboratory pH analyses in this report are reported past the CCME holding time. Bureau Veritas Laboratories endeavours to analyze samples as soon as possible after receipt.
- (5) Orthophosphate > Total Phosphorus Imbalance: When applicable, Orthophosphate, Total Phosphorus and dissolved Phosphorus results were reviewed and data quality meets acceptable levels unless otherwise noted.

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	11.3°C
-----------	--------

Sample WL6342, Elements by ICPMS Low Level (dissolved): Test repeated.

Sample WL6345, Elements by ICPMS Low Level (dissolved): Test repeated.

Sample WL6346, Elements by ICPMS Low Level (dissolved): Test repeated.

Results relate only to the items tested.

N/A = Not Applicable

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference $\leq 2 \times$ RDL).

VALIDATION SIGNATURE PAGE

The analytical data and all QC contained in this report were reviewed and validated by the following individual(s).

Ghayasuddin Khan, M.Sc., P.Chem., QP, Scientific Specialist, Inorganics

Harry (Peng) Liang, Senior Analyst

Rob Reinert, B.Sc., Scientific Spécialist

BV Labs has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per ISO/IEC 17025, signing the reports. For Service Group specific validation please refer to the Validation Signature Page.

CERTIFICATE OF ANALYSIS

BV LABS JOB #: B985971

Received: 2019/10/07, 12:53

indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) This test was performed by BV Labs Vancouver

(2) DOC present in the sample should be considered as non-purgeable DOC. Dissolved > Total Imbalance: When applicable, Dissolved and Total results were reviewed and data quality meets acceptable levels unless otherwise noted.

(3) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).

Encryption Key

Please direct all questions regarding this Certificate of Analysis to your Project Manager.

9626447	Hydroxide (OH)	2019/10/13					<0.50	mg/L		

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

(1) Method blank exceeds acceptance limits for U- 2X RDL acceptable for low level metals determination.

CERTIFICATE OF ANALYSIS

BV LABS JOB #: B995324

Received: 2019/11/04, 12:50

by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) This test was performed by BV Labs Vancouver

(2) DOC present in the sample should be considered as non-purgeable DOC. Dissolved > Total Imbalance: When applicable, Dissolved and Total results were reviewed and data quality meets acceptable levels unless otherwise noted.

(3) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).

Encryption Key

Please direct all questions regarding this Certificate of Analysis to your Project Manager.

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	5.7°C
Package 2	5.0°C

Results relate only to the items tested.

9664141	HCl Preserved Iron (Fe+2 Ferrous)	2019/11/08	100	80 - 120	99	90 - 110	<0.050	mg/L	NC	20

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

(1) Method blank exceeds acceptance limits for Sb- 2X RDL acceptable for low level metals determination.

CERTIFICATE OF ANALYSIS

BV LABS JOB #: B9A3658

Received: 2019/12/02, 13:11

by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) This test was performed by BV Labs Vancouver

(2) DOC present in the sample should be considered as non-purgeable DOC. Dissolved > Total Imbalance: When applicable, Dissolved and Total results were reviewed and data quality meets acceptable levels unless otherwise noted.

(3) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).

Encryption Key

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	15.3°C
-----------	--------

LOW LEVEL DISSOLVED METALS IN WATER (WATER) Comments

Matrix Spike Elements by ICPMS Low Level (dissolved): RDL raised due to concentration over linear range, sample dilution required.

Sample XA9354, Elements by ICPMS Low Level (dissolved): Test repeated.

Results relate only to the items tested.

9697233	Total Zirconium (Zr)	2019/12/05	104	80 - 120	99	80 - 120	<0.00010	mg/L	NC	20
9697798	Dissolved Thallium (Tl)	2019/12/05	104	80 - 120	103	80 - 120	<0.0000020	mg/L	NC	20
9697810	Fluoride (F)	2019/12/05	102	80 - 120	100	80 - 120	<0.010	mg/L	0	20
9697894	Total Ammonia (N)	2019/12/05	100	80 - 120	94	80 - 120	<0.0050	mg/L	8.9	20
9698205	Dissolved Organic Carbon (C)	2019/12/06	NC	80 - 120	99	80 - 120	<0.50	mg/L	1.4	20
9698934	Total Sulphide	2019/12/06	118	80 - 120	98	80 - 120	<0.0018	mg/L	NC	20

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference $\leq 2 \times \text{RDL}$).

VALIDATION SIGNATURE PAGE

The analytical data and all QC contained in this report were reviewed and validated by the following individual(s).

Ghayasuddin Khan, M.Sc., P.Chem., QP, Scientific Specialist, Inorganics

Rob Reinert, B.Sc., Scientific Spécialist

BV Labs has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per ISO/IEC 17025, signing the reports.
For Service Group specific validation please refer to the Validation Signature Page.

Shaneel Dayal	Metal Analyst	Metals, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	Description
µmole/g	micromole per gram

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits
- Reference Material (RM) Report; Recovery and Acceptance Limits
- Method Blank (MB) Report; Recovery and Acceptance Limits
- Laboratory Control Sample (LCS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

<i>Signatories</i>	<i>Position</i>	<i>Laboratory Department</i>

Miles Gropen	Department Manager - Inorganics	Vancouver Inorganics - Water Quality, Burnaby, British Columbia
Shaneel Dayal	Metal Analyst	Vancouver Metals, Burnaby, British Columbia

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.

CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.

DQO = Data Quality Objective.

LOR = Limit of Reporting (detection limit).

RPD = Relative Percentage Difference

= Indicates a QC result that did not meet the ALS DQO.

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.

CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.

DQO: Data Quality Objective.

LOR: Limit of Reporting (detection limit).

RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- **No** Method Blank value outliers occur.
- **No** Duplicate outliers occur.
- **No** Laboratory Control Sample (LCS) outliers occur
- **No** Matrix Spike outliers occur.
- **No** Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- **No** Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- **No** Analysis Holding Time Outliers exist.

Outliers : Frequency of Quality Control Samples

- **No** Quality Control Sample Frequency Outliers occur.

Page : 2 of 4
Work Order : VA19A0564 Amendment 2
Client : Bureau Veritas Canada (2019) Inc. (Maxxam Analytics)
Project : B9A5746

Quality Control Parameter Frequency Compliance

- No Quality Control data available for this section.

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

<i>Analytical Methods</i>	<i>Method / Lab</i>	<i>Matrix</i>	<i>Method Reference</i>	<i>Method Descriptions</i>
Acid Volatile Sulfide by Colourimetry	EC400 Vancouver - Environmental	Soil	EPA 821/R-91-100 (mod)	Acid Volatile Sulfide is determined by colourimetric measurement on a sediment sample that has been treated with hydrochloric acid within a purge and trap system, where the evolved hydrogen sulfide gas is carried into a basic solution by argon gas for analysis.
Simultaneously Extracted Metals by ICPOES (umol/g)	EC495 Vancouver - Environmental	Soil	EPA 821/R-91-100; EPA 6010B	This analysis is carried out in accordance with the method described in EPA 821/R-91-100. Hydrochloric acid is added to sediment samples within a purge and trap system. The extract produced from the addition of the acid is then analyzed for simultaneously extracted metals (SEM) using inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).
Simultaneously Extracted Mercury by CVAAS (umol/g)	EC519 Vancouver - Environmental	Soil	EPA 821/R-91-100/1631E (mod)	An extract of sediment sample that has been treated with hydrochloric acid within a purge and trap system is analyzed by CVAAS.
<i>Preparation Methods</i>	<i>Method / Lab</i>	<i>Matrix</i>	<i>Method Reference</i>	<i>Method Descriptions</i>
Distillation for Acid Volatile Sulfide in Soil	EP400 Vancouver - Environmental	Soil	EPA 821/R-91-100 (mod)	Acid Volatile Sulfide is determined by colourimetric measurement on a sediment sample that has been treated with hydrochloric acid within a purge and trap system, where the evolved hydrogen sulfide gas is carried into a basic solution by argon gas for analysis.
Simultaneously Extracted Metals Preparation	EP495 Vancouver - Environmental	Soil	EPA 821/R-91-100; EPA 6010B	This analysis is carried out in accordance with the method described in EPA 821/R-91-100. Hydrochloric acid is added to sediment samples within a purge and trap system. The extract produced from the addition of the acid is then analyzed for simultaneously extracted metals (SEM) and Mercury .

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

Version 2: Report revised to included updated report for AVS/SEM Subcontracted Data. 2020/02/03

EXCHANGEABLE METALS BY TESSIER LEACH (SOLID) Comments

Matrix Spike ICP-MS DissMET MEND SFE Extract: RDL raised due to concentration over linear range, sample dilution required.

Sample XC2857 [TRIAL 4 EXTRACT 2] ICP-MS DissMET MEND SFE Extract: RDL raised due to concentration over linear range, sample dilution required.

Sample XC2863 [TRIAL 8 EXTRACT 2] ICP-MS DissMET MEND SFE Extract: RDL raised due to concentration over linear range, sample dilution required.

METALS BOUND TO CARBONATES BY TESSIER (SOLID) Comments

Matrix Spike ICP-MS DissMET MEND SFE Extract: RDL raised due to concentration over linear range, sample dilution required.

Sample XC2858 [TRIAL 4 EXTRACT 3] ICP-MS DissMET MEND SFE Extract: RDL raised due to concentration over linear range, sample dilution required.

Sample XC2864 [TRIAL 8 EXTRACT 3] ICP-MS DissMET MEND SFE Extract: RDL raised due to concentration over linear range, sample dilution required.

Sample XC5108 [BLANK EXTRACT 3] ICP-MS DissMET MEND SFE Extract: RDL raised due to concentration over linear range, sample dilution required.

METALS BOUND TO FE & MN OXIDES TESSIER (SOLID) Comments

Sample XC2859 [TRIAL 4 EXTRACT 4] ICP-MS DissMET MEND SFE Extract: RDL raised due to concentration over linear range, sample dilution required.

Sample XC2865 [TRIAL 8 EXTRACT 4] ICP-MS DissMET MEND SFE Extract: RDL raised due to concentration over linear range, sample dilution required.

METALLS BOUND IN ORGANICS BY TESSIER (SOLID) Comments

Sample XC2860 [TRIAL 4 EXTRACT 5] ICP-MS DissMET MEND SFE Extract: RDL raised due to concentration over linear range, sample dilution required.

Sample XC2866 [TRIAL 8 EXTRACT 5] ICP-MS DissMET MEND SFE Extract: RDL raised due to concentration over linear range, sample dilution required.

ELEMENTS BY ATOMIC SPECTROSCOPY (SOLID) Comments

Matrix Spike ICP-MS DissMET MEND SFE Extract: RDL raised due to concentration over linear range, sample dilution required.

Sample XC5107 [BLANK EXTRACT 2] ICP-MS DissMET MEND SFE Extract: RDL raised due to concentration over linear range, sample dilution required.

Results relate only to the items tested.

QUALITY ASSURANCE REPORT(CONT'D)

ALEXCO ENVIRONMENTAL GROUP INC.

Client Project #: BMC-18-02

Site Location: KUDZ ZE KAYAH

QC Batch	Parameter	Date	Matrix Spike		Spiked Blank		Method Blank		RPD		QC Standard	
			% Recovery	QC Limits	% Recovery	QC Limits	Value	UNITS	Value (%)	QC Limits	% Recovery	QC Limits
9736797	1TMS Zirconium (Zr)	2020/01/17			123	N/A	<0.2	mg/kg			145	N/A

N/A = Not Applicable

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

QC Standard: A sample of known concentration prepared by an external agency under stringent conditions. Used as an independent check of method accuracy.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference $\leq 2 \times \text{RDL}$).

(1) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.

VALIDATION SIGNATURE PAGE

The analytical data and all QC contained in this report were reviewed and validated by the following individual(s).

Bonnie Tsang, Lab Technician

David Huang, M.Sc., P.Chem., QP, Scientific Services Manager

Jennifer Villocero, Project Solutions Representative

BV Labs has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per ISO/IEC 17025, signing the reports. For Service Group specific validation please refer to the Validation Signature Page.

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been

CERTIFICATE OF ANALYSIS

BV LABS JOB #: C001490

Received: 2020/01/08, 12:48

accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) This test was performed by BV Labs Vancouver

(2) DOC present in the sample should be considered as non-purgeable DOC. Dissolved > Total Imbalance: When applicable, Dissolved and Total results were reviewed and data quality meets acceptable levels unless otherwise noted.

(3) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).

Encryption Key

Please direct all questions regarding this Certificate of Analysis to your Project Manager.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference $\leq 2 \times \text{RDL}$).

Nitrogen - Nitrate (as N) Low Level Calc (1)	4	N/A	2020/01/17	BBY WI-00033	Auto Calc
Orthophosphate by Konelab (low level) (1)	4	N/A	2020/01/17	BBY6SOP-00013	SM 23 4500-P E m
Total Sulphide	4	N/A	2020/01/20	AB SOP-00080	SM 23 4500 S ₂ -A D Fm

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All

CERTIFICATE OF ANALYSIS

BV LABS JOB #: C002917

Received: 2020/01/15, 14:02

data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) This test was performed by BV Labs Vancouver

(2) DOC present in the sample should be considered as non-purgeable DOC. Dissolved > Total Imbalance: When applicable, Dissolved and Total results were reviewed and data quality meets acceptable levels unless otherwise noted.

(3) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).

Encryption Key

Please direct all questions regarding this Certificate of Analysis to your Project Manager.

RDL = Reportable Detection Limit

N/A = Not Applicable

(1) Detection limits raised due to sample matrix.

(2) Detection limits raised due to dilution to bring analyte within the calibrated range.

9738342	Carbonate (CO3)	2020/01/20					<0.50	mg/L	NC	20
9738342	Hydroxide (OH)	2020/01/20					<0.50	mg/L	NC	20
9738452	Total Sulphide	2020/01/20	NC	80 - 120	109	80 - 120	<0.0018	mg/L	5.0	20

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference $\leq 2 \times$ RDL).

(1) Method Blank exceeds acceptance limits for (Uranium) - $2 \times$ RDL acceptable for low level metals determination.

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied.

CERTIFICATE OF ANALYSIS

BV LABS JOB #: C006266

Received: 2020/01/29, 13:45

BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) This test was performed by BV Labs Vancouver

(2) DOC present in the sample should be considered as non-purgeable DOC. Dissolved > Total Imbalance: When applicable, Dissolved and Total results were reviewed and data quality meets acceptable levels unless otherwise noted.

(3) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).

Encryption Key

Please direct all questions regarding this Certificate of Analysis to your Project Manager.

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	14.3°C
-----------	--------

Results relate only to the items tested.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All

Report Date: 2020/02/12
Report #: R2844045
Version: 1 - Final

CERTIFICATE OF ANALYSIS

BV LABS JOB #: C008107

Received: 2020/02/05, 14:32

data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) This test was performed by BV Labs Vancouver

(2) DOC present in the sample should be considered as non-purgeable DOC. Dissolved > Total Imbalance: When applicable, Dissolved and Total results were reviewed and data quality meets acceptable levels unless otherwise noted.

(3) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).

Encryption Key

Please direct all questions regarding this Certificate of Analysis to your Project Manager.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference $\leq 2 \times \text{RDL}$).

(1) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been

Version: 1 - Final

CERTIFICATE OF ANALYSIS

BV LABS JOB #: C010953

Received: 2020/02/13, 08:50

accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) This test was performed by BV Labs Vancouver

(2) DOC present in the sample should be considered as non-purgeable DOC. Dissolved > Total Imbalance: When applicable, Dissolved and Total results were reviewed and data quality meets acceptable levels unless otherwise noted.

(3) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).

Encryption Key

Please direct all questions regarding this Certificate of Analysis to your Project Manager.

RDL = Reportable Detection Limit

N/A = Not Applicable

(1) Matrix Spike exceeds acceptance limits due to matrix interference. Reanalysis yields similar results.

(2) Detection limits raised due to dilution to bring analyte within the calibrated range.

(3) Sample pH <9, preservation incomplete. Due to volatility of analyte, a low bias in the results is likely.

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	5.3°C
-----------	-------

Sample XK0194 [TRIAL #1] : Sample was analyzed past method specified hold time for Nitrate+Nitrite (N) (low level). Exceedance of hold time increases the uncertainty of test results but does not necessarily imply that results are compromised. Sample was analyzed past method specified hold time for Nitrite (N) (low level). Sample was analyzed past method specified hold time for Orthophosphate by Konelab (low level).

Sample XK0195 [TRIAL #2] : Sample was analyzed past method specified hold time for Nitrate+Nitrite (N) (low level). Exceedance of hold time increases the uncertainty of test results but does not necessarily imply that results are compromised. Sample was analyzed past method specified hold time for Nitrite (N) (low level). Sample was analyzed past method specified hold time for Orthophosphate by Konelab (low level).

Sample XK0196 [TRIAL #5] : Sample was analyzed past method specified hold time for Nitrate+Nitrite (N) (low level). Exceedance of hold time increases the uncertainty of test results but does not necessarily imply that results are compromised. Sample was analyzed past method specified hold time for Nitrite (N) (low level). Sample was analyzed past method specified hold time for Orthophosphate by Konelab (low level).

Sample XK0197 [TRIAL #6] : Sample was analyzed past method specified hold time for Nitrate+Nitrite (N) (low level). Exceedance of hold time increases the uncertainty of test results but does not necessarily imply that results are compromised. Sample was analyzed past method specified hold time for Nitrite (N) (low level). Sample was analyzed past method specified hold time for Orthophosphate by Konelab (low level).

Results relate only to the items tested.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

(1) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.

(2) Method blank exceeds acceptance limits for Tl- 2X RDL acceptable for low level metals determination.

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been

CERTIFICATE OF ANALYSIS

BV LABS JOB #: C013904

Received: 2020/02/26, 12:30

accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) This test was performed by BV Labs Vancouver

(2) DOC present in the sample should be considered as non-purgeable DOC. Dissolved > Total Imbalance: When applicable, Dissolved and Total results were reviewed and data quality meets acceptable levels unless otherwise noted.

(3) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).

Encryption Key

Please direct all questions regarding this Certificate of Analysis to your Project Manager.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

(1) Method blank exceeds acceptance limits for Tl- 2X RDL acceptable for low level metals determination.

VALIDATION SIGNATURE PAGE

The analytical data and all QC contained in this report were reviewed and validated by the following individual(s).

Andy Lu, Ph.D., P.Chem., Scientific Specialist

Ghayasuddin Khan, M.Sc., P.Chem., QP, Scientific Specialist, Inorganics

Harry (Peng) Liang, Senior Analyst

BV Labs has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per ISO/IEC 17025, signing the reports. For Service Group specific validation please refer to the Validation Signature Page.

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been

CERTIFICATE OF ANALYSIS

BV LABS JOB #: C018375

Received: 2020/03/11, 12:06

accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) This test was performed by BV Labs Vancouver

(2) DOC present in the sample should be considered as non-purgeable DOC. Dissolved > Total Imbalance: When applicable, Dissolved and Total results were reviewed and data quality meets acceptable levels unless otherwise noted.

(3) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).

Encryption Key

Please direct all questions regarding this Certificate of Analysis to your Project Manager.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference $\leq 2 \times \text{RDL}$).

(1) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.

(2) Method Blank exceeds acceptance limits for U - $2 \times \text{RDL}$ acceptable for low level metals determination.

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been

CERTIFICATE OF ANALYSIS

BV LABS JOB #: C021661

Received: 2020/03/25, 13:50

accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) This test was performed by BV Labs Vancouver

(2) DOC present in the sample should be considered as non-purgeable DOC. Dissolved > Total Imbalance: When applicable, Dissolved and Total results were reviewed and data quality meets acceptable levels unless otherwise noted.

(3) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).

Encryption Key

Please direct all questions regarding this Certificate of Analysis to your Project Manager.

Safiann Maiter, Key Account Specialist

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	15.3°C
-----------	--------

Sample XP0597, Elements by ICPMS Low Level (dissolved): Test repeated.

Results relate only to the items tested.

9813978	Dissolved Selenium (Se)	2020/04/02			98	80 - 120	<0.000040	mg/L		

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

(1) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) This test was performed by BV Labs Vancouver

(2) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference $\leq 2 \times \text{RDL}$).

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) This test was performed by BV Labs Vancouver

(2) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement. Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference. Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy. Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination. NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration) NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference $\leq 2 \times \text{RDL}$). (1) Method Blank exceeds acceptance limits for Zn - $2 \times \text{RDL}$ acceptable for low level metals determination.

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) This test was performed by BV Labs Vancouver

(2) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).

QC Batch	Parameter	Date	Matrix Spike		Spiked Blank		Method Blank		RPD	
			% Recovery	QC Limits	% Recovery	QC Limits	Value	UNITS	Value (%)	QC Limits
9851832	Total Zirconium (Zr)	2020/05/19	108	80 - 120	101	80 - 120	<0.00010	mg/L	NC	20
Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement. Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference. Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy. Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination. NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration) NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL). (1) Method blank exceeds acceptance limits for TI- 2X RDL acceptable for low level metals determination.

VALIDATION SIGNATURE PAGE

The analytical data and all QC contained in this report were reviewed and validated by the following individual(s).

David Huang, M.Sc., P.Chem., QP, Scientific Services Manager

BV Labs has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per ISO/IEC 17025, signing the reports. For Service Group specific validation please refer to the Validation Signature Page.

'--' data not available. This is during the barrel leach and bench scale testing prior to the system set up (2018-10-11 to 2019-02-22) and the commissioning period (2018-12-37) sampling event.

Table shading: purple = synthetic water testing; no colour = set-up and system commissioning; blue = Stage 1; green = Stage 2; orange = Stage 3

A3. SOIL DATA

Table B3-1: Acid Volatile Sulphides and Simultaneously Extracted Metals (AVS:SEM) in the Soil Collected From *in situ* Cells at the End of Testing

Sample Point	Data Source	Date	Acid Volatile Sulphides (μmol/g)	Simultaneously Extractable Metals (μmol/g)			
				Cadmium	Copper	Lead	Zinc
