EXECUTIVE SUMMARY

BMC Minerals (No.1) Ltd. (BMC) is proposing to develop the Kudz Ze Kayah Mine Project (the Project) in southeast Yukon, Canada which is located in the Kaska Traditional Territory. A comprehensive Reclamation and Closure Plan (RCP) has been developed for the Project. Part of the RCP includes contingency measures that may be considered for implementation if the objectives during the Post-closure phase are not met. The primary contingency measure for the maintenance of water quality is a constructed wetland treatment system (CWTS), which will follow the *in situ* treatment of trace elements in the ABM Lake.

To determine the site specific design of a CWTS for the Project, a phased research approach is being followed. As part of the evaluation, an off site pilot-scale CWTS test program was completed and is presented in this report. The off site pilot-scale CWTS testing and optimization is intended to refine CWTS sizing and expected CWTS outflow water quality for the Project. This is done through the development of site-specific removal rate coefficients, design refinement, and testing of predicted water chemistries not yet present on site.

Constituents of potential interest (COPIs) were identified as those with baseline concentrations that exceeded water quality objectives (WQO) or those predicted to exceed the water quality objectives during the Project phases in the absence of appropriate mitigation measures (AEG and Minnow, 2020). Water quality modelling indicated eight COPIs (arsenic, antimony, cadmium, copper, lead, selenium, uranium, and zinc) are expected to be elevated in ABM Lake relative to the WQOs proposed for the receiving environment (AEG, 2018). These eight COPIs form the focus of the CWTS reporting.

In November 2018, the off site pilot-scale CWTSs were constructed and planted with bulrush (*Schoenoplectus* sp.) and water sedge (*Carex aquatilis*) to assess the extent of COPI treatment with two designs. Synthetic water was designed based on the 2018 “worst case” scenario from the ABM Lake, which assumes a reduced treatment efficiency of water quality predictions in the lake (AEG, 2018).

Information was gathered through the off site pilot-scale CWTS testing to inform design of a full-scale CWTS. The results of the test work showed that treatment of COPIs was more effective in the water sedge CWTS design than the bulrush CWTS, as evidenced by higher removal rate coefficients and lower COPI outflow concentrations. Arsenic, cadmium, lead, selenium, and zinc were treated below receiving environment WQO in both designs, while antimony, copper, and uranium were treated below receiving environment WQO in the water sedge CWTS only.

Minimal plant uptake of COPIs was observed, which is a targeted component of the CWTS design. Measurement of acid volatile sulphides (AVS) found much greater AVS formation in the water sedge CWTS than the bulrush CWTS, which suggests higher stabilisation and buffering capacity for COPI treatment in the water sedge CWTS. An analysis of the microbial populations revealed that the plants used in both CWTS pilot designs, which were collected from the site and surrounding area in 2018, were the source of multiple beneficial selenium-reducing, uranium-reducing, and sulphide-producing bacteria. This indicates targeted treatment mechanisms were established in the pilot CWTS and confirms that the local water sedge plant from site would be a good candidate for full-scale CWTS design.

The pilot-scale testing has provided additional proof-of-concept for CWTS for the Project, demonstrating notable treatment of COPI with the water sedge CWTS design. The pilot-scale test results support the use of a water sedge CWTS as the primary contingency measure for the maintenance of water quality in the Post-closure phase of the Project. It is recommended that the CWTS design and sizing be refined based on the removal rate coefficients (RRC) developed for each COPI based on the water sedge CWTS pilot-scale test results. The refined design and sizing should also consider any updated water quality model results. Recommended future work includes the next phases of CWTS design and

implementation, including on site demonstration-scale optimization to further refine design and testing under site specific influences.

LIST OF APPENDICES

APPENDIX A. RAW AND CALCULATED DATA

APPENDIX B. MICROBIOLOGY REPORT

APPENDIX C. ANALYTICAL DATA

GLOSSARY

Accretion – The process of growth or increase of sediments through deposition and accumulation of organic material deposited solids (such as minerals) in a wetland.

Acidity – A measure of the capacity of water to neutralize base. Influences pH along with alkalinity.

Acid volatile sulphide (AVS) – Sulphide complexed with Fe (FeS) where the sulphide can preferentially exchange Fe for heavy metals (Ni, Zn, Cd, Pb, Cu, Hg) which are then more stably bound.

Alkalinity (Alk) – A measure of the capacity of water to neutralize acids. Influences pH along with acidity.

Amendment – A chemical or organic material added to encourage specific conditions (e.g., aerobic/anaerobic, pH, ORP) or as a source of something that is needed for passive treatment (e.g., nutrients, alkalinity, binding sites).

Aquatic bryophyte – A moss commonly known as aquatic moss.

Biochemical oxygen demand (BOD) – The amount of dissolved oxygen needed by aerobic microorganisms to break down organic material in water.

Biofilm(s) – A visible and often slimy-looking film (community) of bacteria (may contain other microbes).

Carbon source – A source of carbon (energy/electrons) for microbes (see **electron donors**). Examples include ethanol, methanol, acetate, sugar (glucose), molasses, wood chips, detritus (dead plant matter).

Carex aquatilis – A plant (emergent macrophyte) commonly known as water sedge.

Chemical oxygen demand (COD) – A measurement of all organic and inorganic material in the water than can be oxidized.

Constituent of Potential Interest (COPI) – Specific elements that have been identified for evaluation, including antimony, arsenic, cadmium, copper, lead, selenium, uranium, and zinc.

Constructed wetland treatment system (CWTS) – Wetlands that are designed and constructed to remove constituents from water, using natural processes to sequester them into the soils rendering them less bioavailable. They are different from wetlands that provide habitat for wildlife.

Dissolved organic carbon (DOC) – Organic (carbon based) molecules in water, that have passed through a filter of 0.45 µm.

Dissolved oxygen (DO) – Diatomic oxygen (O₂) dissolved in water; oxygen can dissolve in water by diffusion from surrounding air, as a product of photosynthesis, or through forced aeration.

Electron donor(s) – A chemical compound that donates electrons to another compound (see **carbon source**). An electron donor is a reducing agent, which that by virtue of it donating electrons, is itself oxidized (see **oxidation and reduction**).

Explanatory parameters – Quantifiable parameters that describe how water treatment reactions take place.

Evapotranspiration – The process by which water is transferred to the atmosphere by evaporation from the surface of water and by transpiration from plants.

Forebays – Pre-treatment cell areas that allow water to flow through while enabling carbon amendment and promoting reducing conditions without adverse effects plants health.

Genetic analysis – Analysis to assess the presence, identity, and diversity of different microbes in a sample.

Macrophytes – An aquatic plant, large enough to be seen by eye. Can be emergent, submergent, or floating.

Microbes – Microscopic organisms that cab be uni- or multi-cellular. This includes algae, bacteria, fungi, viruses, and yeast.

Oxidation – The loss of electrons, or increase in valence state, by a molecule, atom, or ion. Can be driven by microbes. Process is complementary to chemical reduction.

Oxidation-Reduction Potential (ORP) – A measure of the tendency of a chemical species to acquire or donate electrons, thus becoming reduced or oxidized, respectively, measured in millivolts.

Periphyton – A complex mixture of algae, cyanobacteria, heterotrophic microbes, and detritus that is attached to submerged surfaces in most aquatic ecosystems.

Photolysis – The decomposition or separation of molecules by the action of light.

Phytoremediation – Bioremediation process that uses various types of plants to remove, transfer, stabilize, and/or destroy contaminants in the soil and groundwater.

Reaction stoichiometry – The quantitative relationships among substances as they participate in chemical reactions.

Redox – Oxidation-reduction potential (in sediment), a measure of the tendency of a chemical species acquire or donate electrons, thus becoming reduced or oxidized, measured in millivolts. This measurement is relative to the water ORP.

Reduction (chemical) – The gain of electrons, or a decrease in valence state, by a molecule, atom, or ion. Can be catalyzed by microbes. Process is complementary to chemical oxidation.

Schoenoplectus - A plant (emergent macrophyte) commonly known as bulrush.

Selenium reduction – Microbially mediated reduction of soluble Se(VI) and Se(IV) to insoluble elemental selenium.

Simultaneously extracted metals (SEM) – amounts of metals such as nickel, zinc, cadmium lead, copper, and mercury in sediment, assessed in the context of AVS for excess sulphide. (also see **acid volatile sulphide**)

Sorption – The physical and/or chemical process by which one substance becomes attached to another substance.

Species (sp.) – One of the basic units of biological classification and a taxonomic rank. Rank in the classification of organisms below genus and above strain. Also can be used to refer to the oxidation state of a mineral (e.g., selenate and selenite are species of selenium).

Specific conductivity (SPC) – A measurement of electrical conductivity in water that is typically expressed in $\mu\text{S}/\text{cm}$, which has been adjusted for temperature (25°C).

Sulphide – An inorganic anion of sulphur that can form stable complexes with metals and make them insoluble in water (remove them from the water).

Sulphide production – Microbial reduction of sulphur compounds, such as sulphate, sulphite, thiosulphate, and sulphur, which produces sulphides and alkalinity.

Tessier sequential leaching extractions – procedure based on Tessier et al., 1979 which determines the form and stability of minerals in the substrate through a series of extractions

Total organic carbon (TOC) – A measurement of the total organic carbons present in water.

Total suspended solids (TSS) – A measurement of all particles in water that are larger than $2\text{ }\mu\text{m}$ (anything smaller than $2\text{ }\mu\text{m}$ considered a dissolved solid).

Transfer – Processes that treat water by transferring a constituent to another location without changing its form. For example: absorption, adsorption, dilution, dispersion, filtration, precipitation (aqueous to solid), and volatilization.

Transform – Processes that change the chemical form or state of a constituent. For example: biodegradation, biotransformation, hydrolysis, ionization, oxidation, photolysis, and reduction.

Treatment pathway – The method by which a constituent is treated (Haakensen et al., 2015).

1 INTRODUCTION

BMC Minerals (No.1) Ltd. (BMC) is proposing to develop the Kudz Ze Kayah Mine (the Project) in southeast Yukon, Canada. The Project is located in the Kaska Traditional Territory. A comprehensive Reclamation and Closure Plan (RCP) has been developed with the following main goal: *“To return the mine site and affected areas to viable and, wherever practicable, self-sustaining ecosystems that are compatible with a healthy environment and with traditional land use activities”*. The RCP illustrates the process by which closure measures have been designed to meet this goal and presents a framework for how attainment of the goal will be evaluated through Post-closure monitoring programs. Part of the RCP includes contingency measures that may be considered for implementation if the Post-closure monitoring shows that additional measures are needed to meet the closure goal. The primary contingency measure for the maintenance of water quality is a constructed wetland treatment system (CWTS), which will follow the *in situ* treatment of trace elements in the ABM Lake (Ensero, 2020).

Following an initial evaluation of the feasibility of implementing CWTS at the Project, a phased approach to design a CWTS was implemented in 2015 and Ensero Solutions (Ensero; formerly Contango Strategies, an AEG Company), was retained to undertake the phased design. An overview of the five-phase approach for CWTS design and implementation for the Project is provided in Table 1-1. Additional details of the phased approach are presented in Section 3.2.

Table 1-1: Five Phased Approach for Constructed Wetland Treatment System Design and Implementation

Phase	Objective	Status/Timelines	Report Reference
Phase 1a	Information gathering and site assessment	Completed 2016	Contango, 2016
Phase 1b	Conceptual design and sizing	Completed 2017	Contango, 2017a
Phase 2	Off site bench-scale testing	September 2019 (Interim Report)	AEG, 2019b
Phase 3	Off site pilot-scale testing and optimization	Completed 2020	This report
Phase 4	On site demonstration-scale design and monitoring	Future scope	Future scope
Phase 5	Full-scale implementation	Future scope	Future scope

This report summarizes the off site bench-scale testing (Phase 2) and off site pilot-scale CWTS commissioning and test work (Phase 3). Specifically, this report summarizes:

- Research objectives (Chapter 2);
- Background (treatment objectives, processes, and mechanisms) (Chapter 3);
- Bench-scale test work (Chapter 4);
- Pilot-scale CWTS construction (Chapter 5);
- System commissioning (Chapter 6);
- Operational period monitoring and sampling activities (Chapter 6);
- Data analysis (Chapter 7);
- Treatment of constituents of potential interest (COPs), including stagnation and freeze-thaw testing, fate and distribution of COPs in the CWTS, formation of acid volatile sulphides (AVS), microbiology communities in the CWTS, vegetation growth and the effects of forebays, hydrosol impacts, detritus and accretion in the CWTS (Chapter 8);
- Summary of key findings (Chapter 9); and

- Recommendations and next steps (Chapter 10).

2 OBJECTIVE

The overall objective of off site bench-scale and pilot-scale phases is to refine the CWTS sizing and expected CWTS outflow water quality for the Project. The CWTS sizing and expected outflow water quality were initially presented by AEG (2017) and Contango (2017a). The water quality model was subsequently updated in 2018 (AEG, 2018). This model showed that all WQOs will be met in the receiving environment without the installation of CWTS; therefore, the CWTS became a contingency measure.

Specific objectives of the pilot-scale CWTS testing program are to evaluate and optimize:

- Hydrosol conditions including substrate specifications for construction, microbial communities, and soil amendments;
- CWTS design, including evaluating bulrush and/or water sedge for COPI treatment;
- CWTS performance and stress testing using simulated influent mimicking “worst-case” scenario and varying flow rates to evaluate treatability;
- Fate and distribution of COPs in the pilot-scale system;
- Site-specific removal rate coefficients through analysis of pilot-scale treatment kinetics, overall reaction stoichiometry, and total extents of removal;
- Other aspects of the CWTS design, including detritus decomposition rates and evapotranspiration rates; and
- Seasonal fluctuations through stagnation and freeze-thaw testing.

3 BACKGROUND

3.1 TREATMENT WETLANDS

The Yukon Government states that “*reliance on long term active treatment is not considered acceptable for reclamation and closure planning*” (Yukon Energy, Mines and Resources, 2006). BMC recognizes that reliance on long term “active treatment”, such as long-term active water treatment is not acceptable. As such, the Project is designed for a long-term closure scenario of minimal monitoring and maintenance.

Passive and semi-passive water treatment has been successfully used for removal of metals and metalloids, and neutralization of acidic waters for several decades. There are many examples globally of treatment by constructed wetlands and other passive and semi-passive treatment technologies from which scientific principals can be sourced for application in new systems, along with more recent advances in technology and application (which have been summarized in Ness et al., 2014; Rodgers and Castle, 2008). Regardless of the type of wetland treatment system or geographic location, fundamentals such as thermodynamic laws, Stokes’ laws (settling), stoichiometry, and concepts of coupled biogeochemical reactions are globally applicable, crossing geographical and climatic boundaries. Moreover, there are standard calculations, such as Arrhenius’ equation, that can be applied as necessary to adjust for temperature in chemical reactions.

Successful treatment of mine-influenced water in the north and/or cold climates has been achieved by integrating an understanding of the impacts of a cold climate in the system design phases. In cold climates, passive treatment systems are able to effectively treat mine impacted water (Contango, 2017b). Treatment wetlands are common place worldwide, including in cold-climates, and there are several reported case studies in peer-reviewed scientific literature (Table 3-1).

Table 3-1: Summary of Selected Wetland Case Studies

Preliminary scoping and closure planning suggests that waste source control and pit water treatment (AEG, 2018) will provide substantial primary contaminant load reduction during the closure phases at the Project. CWTSSs have been identified as a feasible contingency measure for passive water treatment for the Project. This is due largely to the existence of wetland systems in the existing ecological condition in the immediate Project vicinity (Geona Creek), and the area within the proposed mine footprint can be converted to a CWTS following the cessation of mining with minimal additional disturbance.

3.2 PHASED APPROACH AND CWTS IMPLEMENTATION

For CWTSSs to be efficient and effective, they must be designed, tested, optimized, and implemented in a site-specific manner (Rodgers and Castle, 2008; Haakensen et al., 2015). This can be achieved using a phased approach, which allows for adjustments to be made and operational boundaries to be identified on a small scale (off site) prior to on site research and/or full-scale implementation. Following a phased approach (Table 1-1), the full-scale system can be built with an optimized design along with a refined operational decision tree and adaptive management plan. This type of phased approach has been developed in academic programs and applied to full-scale applications that have now operated for decades (Hawkins et al., 1997; Huddleston and Rodgers, 2008; Murray-Gulde et al., 2008; Rodgers and Castle, 2008), and is now being applied through Canadian and Northern climates (Fortune Minerals, 2014; Nordin et al., 2010; Ness et al., 2014; Contango, 2014a, 2014c, & 2016a).

Each phase in the development of the CWTS provides progressively more detailed information to inform on the CWTS design and ensure optimal operation and function the CWTS. Table 3-2 below provides an estimate of the time required for completion of each phase of constructed wetland treatment system development. The earliest period of mine operation in which that phase could be undertaken is also indicated.

Table 3-2: Conceptual Schedule of Completion of Phased Implementation of Constructed Wetland Treatment System

Phase		Time Required	Available Time in Operational/Closure Schedule	Earliest Period Applicable
Phase 1a	Information gathering and site assessment	3-6 months		Pre-operational
Phase 1b	Conceptual design and sizing			Pre-operational, once water quality predictions are available
Phase 2	Off site bench-scale testing and optimization	3-6 months	2.5 years until start of <i>Mine Construction</i> , and another 1.5 years during <i>Mine Construction</i>	Pre-operational, once water quality predictions are updated
Phase 3	Off site pilot-scale testing and optimization	8-16 months		After Phase 2 is complete
Phase 4	On site demonstration-scale implementation and monitoring	2-5 years	10 years during <i>Mining Operations</i>	Operational period
Phase 5	Full-scale implementation – North CWTS	1 year for construction and 2 years for commissioning	2 years during <i>Transition Closure</i> as Pit is filling for construction 10 years during <i>Transition Closure</i> as Pit finishes filling for commissioning	After size refinement in Phase 4

3.3 TREATMENT OBJECTIVES

A CWTS is a passive water treatment system specifically designed to treat certain COPIs that may be present in impacted waters. The following summarizes the Project specific COPIs and their associated water quality objectives (WQOs).

COPIs for the Project were identified as those with baseline concentrations that exceeded WQOs or those predicted to exceed the WQOs during the Project phases in the absence of appropriate mitigation measures (AEG and Minnow, 2020). Twenty COPIs have been identified for the Project, which include aluminum, unionized ammonia, antimony, arsenic, cadmium, cobalt, copper, weak acid dissociable cyanide, fluoride, iron, lead, manganese, nickel, nitrate, nitrite, selenium, sulphate, thallium, uranium, and zinc (AEG and Minnow, 2020). Although WQOs are not proposed for ABM Lake, the WQOs proposed for the closest receiving environment station (KZ-37) downstream of ABM Lake were used to screen the concentrations anticipated in ABM Lake in the absence of *in situ* treatment (AEG, 2018). Based on water quality modelling (without ABM Lake treatment) eight COPIs are predicted to exceed the KZ-37 WQOs for the Project (AEG, 2018). These eight COPIs are therefore discussed in this report for treatment in the CWTS (as a contingency measure) and include arsenic, antimony, cadmium, copper, lead, selenium, uranium, and zinc. The applicable WQOs for the eight CWTS COPIs are summarized in Table 3-3. While these eight CWTS COPIs comprise the focus of this report, data are available for all twenty Project COPIs except cyanide and fluoride which were not evaluated through the pilot-scale trials. Cyanide is a product of ore processing during mining operations and is not anticipated to be present in ABM Lake. Fluoride is naturally elevated in surface waters at the Site (AEG, 2019c), but is expected to be present in ABM Lake at levels well below the WQO (AEG, 2018; AEG and Minnow, 2020).

WQOs used for the CWTS pilot-scale system development were a combination of Canadian Council of Ministers of the Environment (CCME, 2018), BC Ministry of Environment (BCMOE, 2017) guidelines and site specific objectives for

Geona Creek at station KZ-37 (AEG, 2018). Updated WQOs were published in 2020 and were used for the assessment of treatment in the pilot-scale CWTS in this report. Details for the selection of 2020 guidelines are provided in the Consolidated Water Quality Objectives Report (AEG and Minnow, 2020). Unless noted otherwise, treatment of cadmium, copper, and zinc are discussed in this report in terms of dissolved concentrations for consistency with the dissolved form of these elements used for water quality objectives in the receiving environment (AEG and Minnow, 2020). Treatment of all other COPIs are discussed in this report in terms of total concentrations for consistency with total form of these elements used for water quality objectives in the receiving environment.

It is important to note that the WQOs were developed for the downstream receiving environment; however, they have been retained for comparison to the pilot-scale CWTS treated concentrations for the purposes of CWTS research. In practice, discharge from the CWTS will likely experience additional dilution from clean runoff prior to reaching the receiving environment station at which the WQOs apply. As such, the use of the WQOs for comparison with the pilot-scale CWTS discharge concentrations is considered conservative. Treatment objectives for the full-scale CWTS will be developed as part of the sizing of that system, in conjunction with the Project water quality model.

Table 3-3: Water Quality Objectives CWTS COPIs

Constituent	Water Quality Objective	Source
Antimony, Total	0.009 mg/L ¹	ENV
Arsenic, Total	0.037 mg/L	SSWQO
Cadmium, Dissolved	0.000377 – 0.000456 mg/L	ENV
Copper, Dissolved	0.00144 mg/L (station KZ-37)	BCP-SSWQO/ENV
Lead, Total	0.012 – 0.017 mg/L	ENV
Selenium, Total	0.00243 – 0.00316 mg/L	SSWQO
Uranium, Total	0.015 mg/L	CCME
Zinc, Dissolved	0.039 – 0.073 mg/L	CCME

BCP – Background Concentration Procedure.

CCME – Canadian Council of Ministers of the Environment.

ENV – British Columbia Ministry of Environment and Climate Change Strategy (formerly BC MOE).

SSWQO – Site-Specific Water Quality Objective.

¹ Ammonia-N guideline presented rather than unionized ammonia-N as no material difference anticipated.

3.4 PROXY REMOVAL RATE COEFFICIENTS

For the Project's conceptual CWTS design and sizing that was performed in Phase 1b (Table 3-2), proxy removal rate coefficients that were developed for other CWTS projects with similar chemistry and conditions to the Project site were used in advance of the development of removal rate coefficients specific to the Project (Table 3-4; AEG, 2017b). These proxy removal rate coefficients that were used to develop conceptual CWTS design and sizing for the Project are compared to the site-specific removal rate coefficients that were developed for the Project through the pilot-scale CWTS test work described herein.

Table 3-4: Proxy Removal Rate Coefficients for Constituents of Potential Interest Based on Other CWTS Projects

COPI	Proxy Removal Rate Coefficients (days ⁻¹)	Source
Antimony	-- ¹	--
Arsenic	0.077	Schwindaman et al. ²
Cadmium	0.48	Other pilot and demonstration testing ³
Copper	0.48	Other pilot and demonstration testing ³
Lead	0.723	Rodgers and Castle ⁴
Selenium	0.456	Other pilot and demonstration testing ³
Uranium	-- ¹	--
Zinc	0.48	Other pilot and demonstration testing ³

Table summarized from AEG, 2017b

¹ Proxy removal rate coefficients are not available.

3.5 TREATMENT PROCESS

Passive treatment systems rely on transfers (e.g., sorption, filtration) and transformations (e.g., photolysis, geochemical/biogeochemical reactions) to remove COPIs from water (Rodgers and Castle, 2008). Biogeochemical transformation reactions are catalyzed by microbes which can be encouraged by targeted environmental conditions in a CWTS. The conceptual CWTS was designed to stimulate microbes that are naturally present at the site (Contango, 2017a). These bacteria oxidize an organic carbon source (such as decaying bulrush or water sedge) and transfer the electrons released to a terminal electron acceptor (TEA). The TEAs are generally used in the order of which is most energetically favorable by microbes. Of the major TEAs typically present in mine-impacted surface waters, Dissolved oxygen is used first, followed by nitrate (NO₃), selenate (Se(VI)), manganate (Mn(IV)), ferric iron (Fe(III)), uranyl (U(VI)), and then sulphate (SO₄) (Borch et al., 2010), creating a “redox (reduction-oxidation) ladder” (Figure 3-1). The order of TEA utilization can also be influenced by pH and TEA concentration.

Redox Potential	Electron Acceptor	Reduction Product
Oxidizing Conditions ↑ ↓ Reducing Conditions	O_2	H_2O
	NO_3	N
	SeO_4	SeO_3
	Mn (IV)	Mn (II)
	Fe (III)	Fe (II)
	U (VI)	U (IV)
	SO_4	HS

Figure 3-1: Redox Potential and Terminal Electron Acceptors

Summarized based on theoretical redox ladder (Borch et al., 2010)

The TEAs are monitored through the CWTS pilot-scale tests to evaluate conditions that have established in the system. The theoretical order of TEA consumption is not absolute, and is used to guide treatment design and performance evaluation. The pilot-scale CWTS have been designed to target sulphate-reducing conditions, to remove TEA above sulphate (e.g., nitrate, selenium, uranium; Figure 3-1) as well as to promote the formation of sulphide which then reacts with chalcophile metals (e.g., cadmium, copper, zinc) to form insoluble sulphide minerals. These insoluble sulphide minerals then precipitate from the water column and are filtered through the CWTS.

Parameters such as dissolved iron and dissolved manganese can also provide insight into the conditions in a CWTS, with increased concentrations of these parameters showing targeted reducing conditions have been achieved based on the theoretical redox ladder (Borch et al., 2010). As manganese and iron are held in the substrate as (hydr)oxides, the development of more reducing conditions can result in their transient release as the host phases are dissolved under manganese- and iron- reducing conditions.

TEA consumption can be influenced by numerous factors including the overall concentrations of reduced and oxidized TEA species, spatial distribution of organic electron donors and TEAs, other residual products, and the abundance and diversity of TEA-metabolizing microbial populations. Latent potential for these natural treatment pathways on site were identified in the site assessment (Contango, 2016). The specific mechanisms for treatment of the COPs are described in Section 3.6.

3.6 TREATMENT MECHANISMS

3.6.1 DENITRIFYING BACTERIA

Even if not in exceedance of water quality objectives, nitrate often requires treatment to subsequently achieve treatment of other constituents such as selenium and uranium, as well as metals and metalloids through sulphide production (Borch et al., 2010; Tan et al., 2016). Nitrate is typically more desired as an electron acceptor by microbes over selenium and sulphate, therefore, microbes will preferentially reduce nitrate. Nitrate can be removed from water through denitrification by different types of microbes, including nitrate-reducing bacteria which can reduce nitrate

(NO₃) to nitrite (NO₂), and also denitrifying organisms that are capable of fully reducing nitrate to nitric oxide (NO), nitrous oxide (N₂O), and subsequently to dinitrogen gas (N₂, which is the most abundant gas in air).

3.6.2 SELENIUM-REDUCING BACTERIA

The targeted selenium treatment pathways in the CWTS include direct reduction in the water column of selenate (Se(VI)) to selenite (Se(IV)) and sorption to moss, detritus, and substrates, and subsequent microbial reduction of soluble (sorbed) selenite (Se(IV)) to insoluble elemental selenium (Se(0)). This reductive process can also be achieved directly in the water column alone but it is more effective when associated with mosses and biofilms due to their sorptive properties that bring the selenium in contact with beneficial selenium-reducing bacteria (SeRB). There are several different types of selenate and selenite-reducing bacteria that reduce these soluble forms of selenium to insoluble elemental selenium (e.g., Gonzalez-Gil et al., 2016; Nancharaiah et al., 2015; Sharma et al., 2015).

3.6.3 URANIUM-REDUCING BACTERIA

Under uranium-reducing conditions, uranium is treated through microbially mediated reduction of soluble uranyl (U(VI)) to uranium in its +4 oxidation state (U(IV)) by uranium-reducing bacteria (URB), followed by U(IV) precipitation as uraninite (Lovley et al., 1991; Shelobolina et al., 2007). Uranyl is reduced under similar conditions as sulphate (anaerobic/reducing); there is overlap between the types of organisms that can produce sulphides and those that are able to treat uranium through reductive processes.

3.6.4 SULPHIDE-PRODUCING BACTERIA

Sulphide production is a key biogeochemical mechanism for water treatment in the CWTS and is carried out by sulphide-producing bacteria (SPB) through the reduction of sulphur-containing compounds (e.g., sulphate, sulphite, thiosulphate, sulphur). This process produces sulphides which bind metals and metalloids (such as antimony, arsenic, cadmium, copper, lead, nickel, thallium, and zinc) as sulphide minerals to produce insoluble precipitates. These SPB thrive in anaerobic conditions with soil redox ranges between -100 and -250 mV (Mitsch and Gosselink, 2007). The percentage and abundance of SPB can be monitored in the CWTS, where they are expected to increase as the system commissions.

4 BENCH-SCALE TEST WORK

The purpose of the bench-scale test work (Phase 2) was to refine the recipe for synthetic water, which was used during the latter part of commissioning and throughout the pilot-scale testing and optimization as influent to the CWTS systems. Bench-scale test work was conducted concurrently with CWTS pilot-scale construction and early commissioning (i.e. when tap water was flowing through the wetland cells).

The synthetic water recipe was based on the 2018 water quality model (AEG, 2018) for overflow from the ABM Lake during the Post-closure phase of the Project. Table 4-1 presents the base case treatment efficiencies from the 2018 water quality model. To evaluate the most conservative water chemistry, it was assumed that the *in situ* ABM Lake treatment was not as effective as initially predicted. It was assumed that *in situ* treatment resulted in 0% to 50% COPI removal rather than the 50% to 95% expected for the base case (Table 4-1). No changes were made to the arsenic concentration in the synthetic water since significant arsenic removal is not expected via *in situ* treatment. Although this scenario is not predicted to occur in the Post-closure phase (based on treatment observed in the concurrent ABM Lake treatment trials) this assumption ensures that the CWTS is designed for a “worst case” scenario (Ensero, 2020).

Table 4-1: Assumed Base and “Worst Case” Percent Removals for ABM Lake *in Situ* Treatment (for Water Quality Influent to the Constructed Wetland Treatment System)

<i>In Situ</i> Treatment Reduction (% Removal)		
Constituent	Base Case	“Worst Case”
Antimony	50%	0%
Arsenic	0%	0%
Cadmium	90%	50%
Copper	95%	50%
Lead	50%	25%
Selenium	50%	25%
Uranium	50%	25%
Zinc	90%	50%

The synthetic water included all constituents predicted to be in the water chemistry, as parameter interactions can impact treatment of certain COPs. Some constituents can interfere with CWTS function, while others can affect treatability of elements in beneficial or detrimental ways (Haakensen et al., 2015). The treatability of water therefore needs to be evaluated as a whole, and not solely focused on COPs. The synthetic water target concentrations are presented in Table 4-2.

All test work was completed at Ensero’s laboratory in Saskatoon. To generate the synthetic water, constituents were added to the City of Saskatoon municipal water (tap water) to achieve the targeted concentrations. Prior to adding constituents to the tap water, the water quality of the tap water (reported by the City of Saskatoon; November 2018) was compared to the target water chemistry to identify those constituents needing amendment. The compounds added to the tap water, where required, are presented in Table 4-2.

Copper concentrations in the synthetic water were higher than targeted concentrations, due to background levels in the tap water which ranged from 0.014 to 0.082 mg/L dissolved copper. Similarly, concentrations of ammonia, chloride, nitrite, and nitrate in tap water were higher than targeted concentrations. These background concentrations will not impact testing or development of a site specific removal rate coefficient, and are not at toxic levels for wetland plants (Contango, 2014b; Contango, unpublished; Friesen et al., 2017; Riley, 2000; Sobolewski et al., 1995). The synthetic influent recipe and the average concentrations achieved in the influent throughout pilot-scale CWTS testing are presented in Table 4-2.

Table 4-2: Target and Average Constituent Concentrations for Synthetic Water for Pilot-scale Constructed Wetland Treatment System Testing

Constituent	Compound Added to Influent	Target – Total Concentration (mg/L) ¹	Average Concentration in Synthetic Water (mg/L) ²	
			Total	Dissolved

⁴ Added through other constituents that contain sulphate and in tap water.

5 CONSTRUCTED WETLAND TREATMENT SYSTEM DESIGN AND CONSTRUCTION

Pilot-scale test work was initiated in November 2018, following receipt of the influent water quality (Chapter 4). The design was based on a hypothetical scenario where the *in situ* treatment of the ABM Lake water did not meet the predicted performance in the Post-closure phase of the Project thus resulting in the need for the implementation of a contingency CWTS to ensure that the water quality in the receiving environment meets the Project's WQOs. The design was also based on species that were identified to be naturally occurring during the initial site assessment (Contango, 2016), and that were subsequently collected during the site visit in 2018.

The anaerobic CWTSs were built in triplicate both to ensure replicability of the experiments, and to allow for replicate specific tests to be conducted (e.g., stagnation, freeze-thaw). The pilot-scale test work design is shown in Figure 5-1. Cells were named A through C from influent to outflow. Series 1 through 3 were planted with bulrush (*Schoenoplectus*) and series 4 though 6 were planted with water sedge (*Carex aquatilis*) collected from the site and surrounding area (Section 5.1.2). Synthetic influent flowed to each series from a single influent tank with metered flow. Forebays were added to four of the series (1, 3, 4, and 6) to evaluate the addition of carbon amendments.

The pilot-scale system design details are provided in Section 5.1 , including substrate and plant species selection and collection. Details of the system commissioning are provided in Section 6.1 including system adjustments, straw addition, and monitoring.

Figure 5-1: Diagram of Pilot-scale Constructed Wetland Treatment System

From left to right: series 1-3 show the anaerobic bulrush cells and series 4-6 show anaerobic water sedge cells. Aquatic moss was also added to each cell. All series had three cells flowing from A through C. Forebays were added before the A cells of series 1, 3, 4, and 6.

5.1 SYSTEM ASSEMBLY

The off site CWTS pilot-scale systems were constructed in a controlled climate facility at the Ensero laboratory in Saskatoon, Saskatchewan. The pilot-scale system was built using 55 gallon plastic barrels to represent individual treatment cells with horizontal surface flow in a series. Individual cells were used to facilitate sample collection

throughout a series and to gather information on treatment kinetics and performance limits through an individual system design. Details of the two sets of systems are provided in Table 5-1.

Table 5-1: Pilot-scale Constructed Wetland Treatment System Construction Details

Series	System Design	Construction Description	Substrate	Water Depth	Vegetation
1 to 3	Anaerobic CWTS with bulrush (<i>Schoenoplectus</i>) and aquatic moss	Three series constructed as replicates, each with three cells Cell dimensions: diameter 57 cm, height 93 cm, volume 237 L	Sand and woodchip substrate added to a height of 30 cm in each cell	50 cm	Bulrush harvested in 2018 from Coffee Lake (approximately 150 km from the Project site) Aquatic moss harvested from site
4 to 6	Anaerobic CWTS with water sedge (<i>Carex aquatilis</i>) and aquatic moss	Three series constructed as replicates, each with three cells Cell dimensions: diameter 57 cm, height 65 cm, volume 166 L	Sand and woodchip substrate added to a height of 30 cm in each cell	30 cm	Water sedge harvested from the Project site in 2018 Aquatic moss harvested from site

5.1.1 SUBSTRATE

The selected substrate mixture of 90% medium to coarse sand and 10% wood chips (Photograph 5-1) was designed to achieve the targeted hydraulic conductivity, facilitate reducing conditions, ensure structural stability, and prevent resuspension. Medium to coarse sand was used in the CWTS consisting of grains with a diameter between 0.2 to 1 mm and a critical resuspension linear flow velocity of 2 to 10 cm/s. The resulting mixture had a porosity of approximately 23%. Slow release fertilizer was also added into the substrate to promote growth of the plants during commissioning. Organic material (wood chips) was supplemented into the sand to provide carbon for the CWTS while the system matures.

Photograph 5-1: Substrate Added to Cells During Pilot-scale Constructed Wetland Treatment System Construction

Substrate consisted of 90% sand and 10% woodchips by volume.

5.1.2 PLANT SELECTION

The pilot-scale CWTS was designed to create conditions that are: sustainable; minimize uptake of constituents into vegetation; and, promote direct mineralization and decreased bioavailability. Considerations regarding plant selection included: physiology (e.g. radial oxygen loss, water depth tolerance); biomass production per year versus decomposition rate (accretion factor); bioconcentration tendencies; effective plant density; flow rate tolerance; structural capacity; capacity for prevention of sediment resuspension; transpiration rate; and provision for microbial habitat and nutrients.

A site assessment (conducted in August 2015) resulted in two plant species of interest being chosen for the pilot-scale CWTS (Contango, 2016) – water sedge and bulrush. These plant species were collected during the July 2018 site visit and were maintained in Ensero’s nursery facility until construction of the pilot-scale CWTS.

Water sedge and aquatic mosses were found ubiquitously at the Project, at all sites sampled in the 2015 site assessment (Contango, 2016), including along Geona Creek and Finlayson Creek. As such, water sedge and aquatic mosses were collected directly from the Project site for the pilot-scale CWTS. Bulrush was not found at the Project, but was found at nearby Coffee Lake, at km 350 of the Robert Campbell Highway and was collected from Coffee Lake for use in construction of the pilot-scale CWTS.

Bulrush are of interest for CWTS design as they are known to create reducing conditions in treatment wetlands (Murray-Gulde et al., 2005; Rodgers & Castle, 2008). Additionally, bulrush have a greater water depth tolerance than

sedge species (approximately 100 cm versus 30 cm), and thus may provide a greater range of design options. The greater water depth would allow for a longer hydraulic retention time (HRT) in the same footprint, which may be useful depending on flow rates and land area available for full-scale construction. Greater water depths would also decrease the turbulence in the wetland during periods of high water flow and high winds, and increase the time available for suspended solids to settle in the wetland.

Sedge offer a range of flexibility in CWTS function, as either oxidizing or reducing conditions can be established using different substrates (sand or gravel) and water depths in the design. Sedge roots generally have low radial oxygen loss and can promote reducing zones even at water depths of 20 to 30 cm (Haakensen et al., 2015). Pilot-scale studies conducted for other mine sites in Yukon for metal and metalloid treatment of circum-neutral water have confirmed that sedge are readily amenable to transplantation, can host an abundance of beneficial microbes, and can promote conditions for mineralization of a range of elements, with very little COPI uptake (Haakensen et al., 2015).

Wetland plants are also known to be peat forming with high accretion rates, thus trapping minerals in the soils which decreases bioavailability, prevents resuspension, and maintains low overall concentrations of COPI (e.g., Murray-Gulde et al., 2008). Over time, precipitated COPI minerals aggregate to former larger particles, which decreases their solubility (e.g., Moreau et al., 2004). Furthermore, the amorphous iron sulphides that initially form under sulphate-reducing conditions within CWTS and which can co-precipitate COPI metals will transform with aging to more crystalline forms which are more resistant to solubilization, forming an important sink for trace metals (Huerta-Diaz et al., 1998). Burial of these phases with time also enhances their stability by limiting their exposure to any oxidizing fluids or gases that may occasionally intrude on the CWTS.

In addition to water sedge or bulrush, each series was supplemented with aquatic bryophytes (mosses). Mosses have long been known as metal accumulating organisms useful in remediation (Aldrich & Feng, 2000). Aquatic mosses are particularly useful in CWTS as they have a high sorption capacity and contribute to both sulphide-producing conditions and accretion of soils. In contrast to macrophytes (e.g., water sedge and bulrush), mosses tend to uptake large amounts of elements, both through sorption and filtration (Aldrich & Feng, 2000; Gstoettner & Fisher, 1997). Mosses are a relatively benign sink for these elements, as they are not a food source for invertebrates or higher animals and as such do not contribute greatly to bioaccumulation (Haines & Renwick, 2009; Longton, 1997; Suren & Winterbourn, 1991).

6 METHODS FOR SYSTEM COMMISSIONING AND OPERATION

6.1 SYSTEM COMMISSIONING

The commissioning period enables plants and microbes to acclimate and mature in the pilot-scale system prior to the commencement of testing. The commissioning period began on November 23, 2018 with completion of the pilot-scale CWTS construction. After construction, all cells were filled to a water depth of 10 cm with tap water. As plants matured, the water depth was increased gradually to a final depth of 50 cm in the bulrush cells and 30 cm in the water sedge cells, with flow beginning after full depth was reached. Synthetic water (influent) (Chapter 4) began flowing through the CWTS on March 5, 2019 once the plants were thriving and the synthetic water recipe was finalized. Hydraulic Retention Times during commissioning were 16 days in the bulrush series and 13 days in the water sedge series. The Hydraulic Retention Time in the water sedge series was adjusted to 9.5 days to prevent cells from becoming too reducing following the addition of straw while the plants were establishing (Section 6.1.1). Temperatures during commissioning were set to 30°C during the day and 15°C at night for the first three months of commissioning to expedite plant growth. For the last two months of commissioning, temperatures were on average 25°C during the day and 15°C at night to continue promoting plant establishment and based on temperature influences by external seasonal temperature fluctuations.

6.1.1 ADJUSTMENTS DURING COMMISSIONING PERIOD

Adjustments administered and defined through pilot-scale testing will be used to inform on site demonstration-scale and full-scale CWTS implementation. The adjustments are primarily aimed at promoting plant and microbial growth during commissioning. Adjustments were made throughout the commissioning period until May 17, 2018, when the system transitioned to the operational period (Table 6-1). These adjustments generally fall in the following categories:

1. Gradual water depth adjustment;
2. Gradual carbon (straw) addition (Section 6.1.2); or
3. Flow adjustment.

These adjustments are dictated based on the requirement to obtain reducing conditions, where higher water depth, more available carbon substrate, and/or lower flow rates promote more reducing conditions.

Table 6-1: Adjustments to Pilot-scale Constructed Wetland Treatment Systems During Commissioning

Date	Adjustments to Pilot-scale System
23-Nov-18	Construction completed. Water at a depth of 10 cm in all cells.
28-Nov-18	Adjusted water depth. Bulrush (series 1 and 2) depth increased to 30 cm. Water sedge (series 4 and 5) depth increased to 20 cm.
10-Dec-18	Adjusted water depth. Bulrush (series 3) depth increased to 30 cm. Water sedge (series 6) depth increased to 20 cm.
14-Dec-18	Adjusted water depth. Bulrush (series 1 and 2) depth increased to 50 cm. Water sedge (series 4 and 5) depth increased to 30 cm.
04-Jan-19	Adjusted water depth. Bulrush (series 3) depth increased to 50 cm. Water sedge (series 6) depth increased to 30 cm.
07-Jan-19	Started flow. Bulrush (series 1 and 2) set to 20 mL/min (16-day HRT). Water sedge (series 4 and 5) set to 15 mL/min (13-day HRT).
14-Jan-19	Started flow. Bulrush (series 3) set to 20 mL/min (16-day HRT). Water sedge (series 6) set to 15 mL/min (13-day HRT).
24-Jan-19	Soil redox probes installed in every cell.
12-Feb-19	Straw added to all cells.
05-Mar-19	Synthetic influent began flowing through CWTS. Straw added to all cells.
12-Mar-19	Straw added to all cells.
15-Mar-19	Increased flow in water sedge CWTS to 20 mL/min (9.5-day HRT) as dissolved oxygen levels were very low.
19-Mar-19	Straw added to bulrush cells.
22-Mar-19	Outflow water sampling event.
26-Mar-19	Straw added to water sedge cells.
08-Apr-19	Straw added to all cells.
15-Apr-19	Outflow water sampling event.
16-Apr-19	Additional water sedge transplanted into cells 5C and 6C. Water sedge sourced from the KZK Site and kept in a nursery at Ensero.
18-Apr-19	Straw added to bulrush cells.
29-Apr-19	Straw added to bulrush cells.
06-May-19	Straw added to bulrush cells.
17-May-19	Decreased flow in water sedge CWTS to 12 mL/min (16-day HRT) to match bulrush CWTS for low flow testing period. Start of testing period.
21-May-19	Accretion bags installed (Section 6.11).

HRT = hydraulic retention time.

6.1.2 STRAW ADDITION

Organic carbon is necessary in a CWTS as it is used as an electron donor by beneficial microbes and facilitates the development of reducing conditions that drive COPI treatment in a mature system (e.g., Murray-Gulde et al., 2008). In a mature CWTS, the growth of water sedge and bulrush provides a renewable organic carbon source to the CWTS, thereby limiting the need for carbon supplementation in an operating wetland in most instances (Rodgers & Castle, 2008; Murray-Gulde et al., 2008). While a new CWTS matures and plants establish, a supplemental organic carbon source is typically needed. The amount of carbon supplemented in commissioning was estimated based on the amount of carbon expected to be provided by a mature system based on previous wetland studies (Table 6-2; Contango, unpublished). The biomass produced by a given plant type per square meter of wetland is intended to be refined through on site demonstration-scale testing.

Based on results from previous pilot-scale CWTS studies with a similar design to the KZK pilot-scale trial, mature bulrush and water sedge CWTS were anticipated to add 50 g/m² and 1272 g/m² of dry organic material per year, respectively. Table 6-2 presents the amount of straw that was added to each cell to supplement organic carbon during commissioning. Additional straw was added to the bulrush cells to try to promote more reducing conditions and to help commission the system. The straw was added in nine increments over twelve weeks to ensure the plants had enough time to adjust to the changes in conditions.

Table 6-2: Total Straw Added to Each Cell Based on Plant Species

Series	Plant Type	Theoretical Organic Material Added per Year (dry wt. g/m ²) ¹	Total Straw Added to Each Cell (dry wt. g)	Total Straw Added to Series (dry wt. g/m ²) ²
1 – 3	Bulrush	50	100	392
4 – 6	Water Sedge	1270	277	1080

¹ Based results from previous CWTS studies with a similar design to the KZK pilot-scale trial (Contango, unpublished).

² Based on the total amount of straw added to full series divided by the surface area of each series (0.766 m²); three cells per series.

6.1.3 SAMPLING AND MONITORING DURING COMMISSIONING PERIOD

Sampling and *in situ* testing was performed during pilot-scale commissioning to evaluate commissioning progress. Periodic nutrient testing was conducted to ensure that sufficient nitrogen and phosphorous were present in the system to optimize plant growth. Once influent was initiated through the system to prime for operations (March 5, 2019), water samples were collected and sent for analysis of routine cations, total metals and dissolved metals to evaluate conditions and to inform load removal (Section 7.1). Influent and outflow water samples were collected on March 22 and April 15, 2019 according to methods described in Section 6.3. Additionally, YSI and soil redox measurements were taken on a weekly basis to monitor conditions in the pilot-scale CWTS during commissioning according to methods described in Section 6.3.

6.2 OPERATIONAL TEST PERIODS

The operational test period was initiated on May 18, 2019 based on conditions in the pilot-scale CWTS (Section 8.1). Operational testing consisted of three stages, which were ordered to guide decision-making throughout the operational period (Figure 6-1). Operational testing consisted of four flow periods: low flow, medium flow, high flow, and very low flow (Figure 6-1).

Flow rates were set during each testing period to achieve a range of HRTs in the pilot-scale CWTS. The range of HRTs was estimated based on the monthly flows presented in the water quality model (AEG, 2018) and potential HRTs that may occur in the full-scale system (Table 6-3). Minimum, maximum, and average flows from May to October were used to calculate the wetland sizes predicted to be needed for the full-scale CWTS using inflow chemistry (Chapter 4), WQOs for the downstream receiving environment (Section 3.3), and proxy removal rate coefficients (Section 3.4). This was done using the rearranged rate removal coefficient equation that is described in Section 7.2 (Equation 7-1). The flow rates in Table 6-3 and the calculated wetland sizes were then used to calculate the range of HRTs that may be observed using the HRT equation (Equation 6-1), which guided the selection of HRTs for testing in the pilot-scale CWTS. The HRT and flow rates for each flow period of the pilot-scale trials are provided in Table 6-4.

Figure 6-1: Testing Schedule for Pilot-scale Constructed Wetland Treatment System

Operational testing in stage 2 includes testing with very low flow (series 2 and 5), and with low, medium and high flow (series 1, 3, 4, and 6). Seasonal testing includes stagnation and freeze-thaw testing.

Table 6-3: Monthly Flow Volume and Daily Flow Rates of Water Leaving the ABM Lake During Post-closure (Year 27) from AEG (2018)

Month	Water Quality Model Flow Volume (m ³)	Daily Flow Rate (m ³ /day)	Month	Water Quality Model Flow Volume (m ³)	Daily Flow Rate (m ³ /day)
January	56,903	1,835	July	440,704	14,216
February	43,320	1,547	August	293,571	9,470
March	49,958	1,611	September	219,167	7,305
April	44,074	1,469	October	142,250	4,588
May	212,184	6,844	November	75,499	2,516
June	478,841	15,961	December	63,678	2,054

Table 6-4: Hydraulic Retention Times and Flow Rates for Each Testing Period in Bulrush and Water Sedge Pilot-scale Constructed Wetland Treatment System

Flow period	HRT (days)	Flow rate (mL/min)	
		Bulrush	Water Sedge
Very low flow	25	13	7.5
Low flow	16	20	12
Medium flow	5	65	38
High flow	1.5	210	127

$$t = \frac{V}{Q}$$

Where:

t is the hydraulic retention time

V is the volume of water in the system

Q is the flow rate

Equation 6-1: Hydraulic retention time based on known volume and flow rate

6.3 FOREBAY CONSTRUCTION

Forebays were added to series 1 and 3 (bulrush) and 4 and 6 (water sedge) on September 17, 2019 to evaluate carbon supplementation through a forebay. Forebays were constructed from 18 L buckets and located at the start of each series, intercepting the influent before it was received by the A cell. A total of 100 g of straw was added in two 50 g increments to each forebay.

6.4 WATER MONITORING

Water monitoring occurred in conjunction with each sampling event during the operational phase from May 18, 2019 to January 13, 2020. *In situ* water DO (mg/L), temperature (°C), pH, conductivity (micro Siemens per centimeter [$\mu\text{S}/\text{cm}$]), specific conductivity (SPC; $\mu\text{S}/\text{cm}$), and ORP (mV) were measured following the collection of all water samples from the outflow of each cell. Measurements were conducted with a YSI Professional Plus handheld unit calibrated according to the manufacturer's instructions. There were at minimum three sampling events per flow period (Section 6.2). The sampling events were conducted at a frequency according to the HRT of a given flow period to ensure a full HRT had passed between sampling events (e.g., at a 25 day HRT during the very low flow period, sampling events were at minimum 26 days apart). Routine monitoring frequency and samples collected are presented in Table 6-5.

Water sampling was conducted according to Ensero's sampling protocols, developed following the "*Standard methods for the examination of water and wastewater*" (Rice et al., 2012), which was co-produced by the American Public Health Association, the American Water Works Association, and the Water Environment Federations.

Water samples were collected from downstream to upstream (e.g., C cell to A cell) in the pilot-scale CWTS to ensure that water sampling did not affect sample collection from the downstream cell (e.g., disrupting flow rates or suspending

solids). Water samples were collected from the outflow of each cell and the influent for all sampling events for analysis of total and dissolved metals, as well as routine cations and anions. Additional samples were collected once per flow period for analysis of parameters, including acidity, total suspended solids (TSS), chemical oxygen demand (COD), biological oxygen demand (BOD), dissolved organic carbon (DOC), total organic carbon (TOC). Samples were collected in clean, laboratory supplied sample bottles appropriate for each analysis parameter. Sample collectors wore clean and new nitrile gloves. Bottles were capped immediately after filling. All samples were collected in labelled bottles that identified the sample location, date and time of collection, field filtering and/or preservation and analysis requested. Samples were filtered and/or preserved according to the analytical service provider's instructions (Bureau Veritas Laboratories [BVL]). All samples were stored in coolers with freezer packs to remain cold (4°C), but not frozen, during sampling and during transport to BVL. The sampling schedule is provided in Table 6-5. Chain of Custody (COC) forms were completed at the time of sampling and contained all information from the sample bottle labels. COCs signed by the sampler were packed inside the coolers used to transport samples to the laboratory.

Modified sampling techniques were used for sampling during the freeze-thaw testing and stagnation testing as described in Section 6.9 and Section 6.10.

Table 6-5: Water Sampling Constituents and Schedule in Operational Testing Stages 1 & 2

Test Constituents	Frequency	Sample Location	Total Number of Samples	Number of Sampling Events
Temperature (°C)	Every sampling event: minimum three sampling events per flow period at frequency according to HRT (Table 6-4)	All cells and influent	328	22
pH				
Dissolved oxygen (DO) (mg/L)				
Conductivity (µS/cm)				
Oxidation reduction potential (ORP) (mV)				
Specific conductivity (SPC) (mV)				
Influent rates (mL/min)	Every sampling event: minimum three sampling events per flow period at frequency according to HRT (Table 6-4)	Influent rate into each series was measured	132	22
Total suspended solids (mg/L)	Once per flow period; third sampling event of each flow period (final HRT)	Outflow water from each series, and influent	103	7
Total dissolved solids (mg/L)				
Acidity (mg/L)				
Biological oxygen demand (mg/L)				
Chemical oxygen demand (mg/L)				
Dissolved organic carbon (mg/L)				
Total organic carbon (mg/L)				
Alkalinity (total CaCO ₃), HCO ₃ ⁻ , CO ₃ ²⁻ , Cl, Ca, Mg, K, Na, SO ₄ , Hardness (as CaCO ₃) (mg/L) Cation-Anion Balance (meq/L)	Every sampling event: minimum three sampling events per flow period at frequency according to HRT (Table 6-4)	Outflow water from each cell, and influent	328	22
Low level total and dissolved metals by ICP-MS (Al, Sb, As, Ba, Be, Bi, B, Cd, Ca, Cs, Cr, Co, Cu, Fe, Pb, Li, Mg, Mn, Mo, Ni, P, K, Rb, Se, Ag, Na, Sr, S, Te, Tl, Th, Sn, Ti, W, U, V, Zn, Zr) (mg/L)	Every sampling event: minimum three sampling events per flow period at frequency according to HRT (Table 6-4)	Outflow water from each cell, and influent	328	22
Nitrate + Nitrite (as-N) (mg/L)				
Ammonia as N	Every sampling event in Stage 2: minimum three sampling events per flow period at frequency according to HRT (Table 6-4)	Outflow water from each cell, and influent	138	12

6.5 SUBSTRATE TESTING

The substrate in the pilot-scale CWTS was tested during construction of the systems as well as at the end of the pilot CWTS testing. Additionally, *in situ* soil redox potential (mV) was monitored during commissioning and in conjunction with each sampling event during the operational phase from May 18, 2019 to January 13, 2020. The substrate sampling schedule is presented in Table 6-6.

In situ soil redox potential was measured during each sampling event following the collection of water samples. Soil redox potential (mV) was measured using inert electrodes (copper wire probes with platinum tips) that were

permanently installed in the substrate of the cells and remained there for the duration of the operations phase of the pilot-scale program to ensure accurate readings (Faulkner et al., 1989). During sampling events, a reference electrode (Accumet Silver Chloride) was suspended in the water column above the inert electrode. The redox potential was then measured in millivolts by a voltmeter.

An initial sample of the sand and woodchip mixture (used as substrate in the pilot-scale CWTS) was sent for analysis prior to construction of the system to ensure the substrate was free of significant amounts of leachable metals and to determine initial concentrations of constituents in the substrate (Section 6.1.3). Substrate samples were collected at the end of pilot scale testing from each series, on December 17, 2019 following very low flow testing (series 2 and 5), on December 20, 2019 following freeze-thaw testing (series 3 and 6), and on January 13, 2020 following stagnation testing (series 1 and 4). Additional sampling was performed for acid volatile sulphides and simultaneously extracted metals (AVS+SEM) prior to the stagnation and freeze-thaw testing (December 13, 2019) from series 1, 3, 4, and 6. Samples were sent to BVL for evaluation of AVS+SEM, detailed salinity, nutrients, sequential leach Tessier extraction, TOC, total metals (by ICP-MS), and sulphate concentrations.

Substrate samples were collected by gloved hand from the top ~5 cm of substrate in each CWTS cell in the systems. All samples unless noted otherwise were placed into labelled bags provided by BVL and any excess water was poured off after collection. AVS+SEM and Tessier samples were collected in 125 mL glass jars provided by BVL and capped under water with minimal headspace. Following United States Environmental Protection Agency method 821-R-91-100 (USEPA, 1991), the samples were then put into a glove bag under a nitrogen atmosphere to minimize oxidation of the sample. The surface of the sample was flushed to deoxygenate the overlying water and ensure any minimal headspace that remained was oxygen free (USEPA, 1991). All samples were stored in coolers with freezer packs to remain cold (4°C), but not frozen, during sampling and during transport to BVL.

Table 6-6: Substrate Sampling Constituents and Frequency

Test Constituents	Frequency	Sample Location	Total Number of Samples	Number of Sampling Events
Texture (% of each size fraction)	Prior to construction ²	Initial sand and woodchip mixture	1	1
% Saturation	Prior to construction ²	Initial sand and woodchip mixture ²	19	2
Total organic carbon (mg/kg)	At end of pilot-scale testing	Substrate from each cell (or pooled from replicate cells)		
Soil redox (mV)	Every sampling event in Table 6-5	All cells	396	22
AVS+SEM ¹ (μmol/kg)	Prior to construction ² Prior to freeze-thaw and stagnation testing At end of pilot-scale testing	Initial sand and woodchip mixture ² Composite series 1 & 3 and 4 & 6 A and C cells (Pre-stagnation and freeze-thaw testing samples) A and C cells of all series (final take-down samples)	17	3
Sodium adsorption ratio (SAR)	Prior to construction ² At end of pilot-scale testing	Initial sand and woodchip mixture ² Substrate from each cell	19	2
Available nutrients (N, P, K, S) (mg/kg)				
Sulphate (SO ₄) (mg/kg)				
Conductivity (μS/cm)				
Sequential leach Tessier extraction (Al, Sb, As, Ba, Be, Bi, Cd, Ca, Cr, Co, Cu, Fe, Pb, Li, Mn, Mo, Ni, P, K, Se, Ag, Na, Sr, Tl, Sn, Ti, U, V, Zn) (mg/kg)				
Total metals by ICP-MS ³ (Al, Sb, As, Co, Cu, Fe, Pb, Li, Mg, Mn, Mo, Ni, P, K, Se, Ag, Na, Sr, Tl, Sn, Ti, U, V, Zn, Zr) (mg/kg)				
Leachable metals (Al, Sb, As, Ba, Be, Bi, B, Cd, Cr, Co, Cu, Pb, Mn, Mo, Ni, K, Se, Ag, Na, Sr, Tl, Sn, U, V) (mg/kg)	Prior to construction ²	Initial sand and woodchip mixture	1	1

¹AVS+SEM: Acid-Volatile Sulphide + Simultaneously Extracted Metals.

²Analyses completed prior to construction on sand and woodchip mixture.

³ICP-MS: Inductively coupled plasma mass spectrometry.

COPs were evaluated at the end of the operations period via the Tessier sequential extraction method (Tessier et al., 1979) to aid in understanding the COP mineral formation as well as mineral association in the substrate (Table 6-7). This information helps guide CWTS design decisions, which aim to target biogeochemically stable mineral forms.

Table 6-7: Summary of Extractable Fractions From Tessier Sequential ICP-MS Analysis ¹

Fraction	Description	COPs Unstable When
1	Exchangeable fraction for adsorbed elements	Readily released (i.e., soluble and exchangeable)
2	Element fraction bound to carbonates	Decreased pH
3	Element fraction bound to Fe-Mn oxides	Reducing conditions
4	Element fraction bound to organic matter and sulphides	Oxidizing conditions
5	Residual element fraction (primary and secondary minerals)	Not expected to be released in solution over time under conditions normally encountered in nature

¹Tessier et al., 1979.

6.6 PLANT AND ORGANICS SAMPLING

Water sedge and bulrush samples were collected from each series at the end of pilot-scale testing (Table 6-8). During sampling, all above water plant biomass was collected from each CWTS cell and weighed. Only the above water plant biomass was sampled and analyzed as it is the portion of the plant that is not in direct contact with the water and is therefore representative of the concentrations of metals in the plant tissue. Plants were cut off at the water level using sterilized shears and nitrile gloves were worn throughout sampling. Samples were placed into pre-weighed sterile plastic bags and weighed. All of the above water plant biomass that was harvested from the cell was then sent to BVL for analysis of total metals and percent moisture. Replicates were based on replicate pilot-scale series.

Samples of organic material in the water column were collected from each cell in each series by gloved hand at the end of pilot-scale testing (Table 6-8). Organics samples included all organic material that was suspended in the water column (i.e. moss, decomposing straw, and duckweed). Samples were placed into pre-weighed plastic bags provided by BVL and any excess water was poured off after collection. The full amount of organics from the cell was weighed and then sent to BVL for analysis of total metals and percent moisture. Replicates were based on replicate pilot-scale series. All samples were stored in coolers with freezer packs to remain cold (4°C), but not frozen, during sampling and during transport to BVL.

Table 6-8: Plant and Organics Sampling Constituents and Frequency

Test Constituents	Frequency	Sample Location	Total Number of Samples	Number of Sampling Events
% Moisture	At end of pilot-scale testing	Above water plant biomass (water sedge and bulrush), and organics within the water column	36	1
Total Metals by ICP-MS (Al, Sb, As, Co, Cu, Fe, Pb, Li, Mg, Mn, Mo, Ni, P, K, Se, Ag, Na, Sr, Tl, Sn, Ti, U, V, Zn, Zr)				

6.7 LABORATORY QUALITY CONTROL SAMPLE ANALYSIS

Laboratory analysis were performed by BVL. Overall quality control sample analysis from method blanks, laboratory duplicates, matrix spikes and blank spikes met the BVL laboratory acceptability criteria and consequently the data were issued.

6.8 MICROBIAL SAMPLING

Microbes are the catalysts for the beneficial biogeochemical reactions occurring in the CWTS. Microbial testing can be used to compare microbial communities established in different locations (e.g., substrate, moss, or plant roots) and over time throughout CWTS operation. The microbial communities in the CWTS were tested with the initial materials used to construct the CWTS (November 23, 2019), as well as after each stage of the operational test periods outlined in Section 6.2 to evaluate the distribution and establishment of beneficial microbes in each CWTS design. Microbial samples that were analyzed during the site assessment in 2016 are discussed in Contango 2016.

Microbial testing included genetic quantification of bacteria associated with specific sample types via quantitative polymerase chain reaction (qPCR), as well as genetic sequencing via the 16S ribosomal RNA gene to identify the bacterial community and distribution of the beneficial organisms described in Section 3.6). Samples were collected by clean nitrile gloved hand from the substrate, plant roots, and moss in specific cells at each sampling event and placed in sterile tubes provided by Ensero's microbiology laboratory. Samples were composited between replicates series from the A or C cells for the end of operational stage 1 testing samples. One additional sample of each sample type was collected from the water sedge A cell post-stagnation on January 7, 2020 to evaluate the effects of stagnation. The samples were stored in a freezer prior to quantification and genetic sequencing analysis at Ensero's lab.

The bacterial DNA was extracted from the samples using Ensero in-house methods. Targeted DNA sequencing was used to identify bacteria present in each sample via polymerase chain reaction (PCR) amplification of the v3/v4 region of the 16S ribosomal RNA gene as per the manufacturer's instructions for MiSeq v3 paired-end 300 bp sequencing (Illumina) for all samples and positive and negative controls. After sequencing, the forward and reverse reads were merged and all sequences were quality filtered before clustering and classification. Quantification was performed through the amplification and measurement of the 16S ribosomal RNA gene, including positive and negative controls and standard curve, using the Biorad CFX Real-Time PCR Detection System.

The parameters and frequency of testing for microbes are outlined in Table 6-9, with dates of microbial sample collection in Table 6-10.

Table 6-9: Microbial Sampling Parameters and Frequency

Test Parameters	Frequency	Sample Location	Total Number of Samples	Number of Sampling Events
Quantification analysis	Initial samples from substrate, plant roots, and moss	Substrate, moss, and root pooled from replicate A and C cells	55	4
Genetic sequencing analysis for bacterial community composition and distribution of beneficial organisms	At the midpoint of testing (Aug)			
	At end of Stage 2 testing			
	At the end of stagnation ¹			

¹ Samples were collected from cell 4A following stagnation.

Table 6-10: Dates and Locations of Microbial Sample Collection

Sample Date	Sample Period	Location	Sample Types
23-Nov-18	Initial – Start of Commissioning	Bulrush root, water sedge root, moss, substrate	Moss, root, and substrate
14-Aug-19	End of Operational Testing: Stage 1	Bulrush A cells (composite), bulrush C cells (composite), water sedge A cells (composite), water sedge C cells (composite)	
3-Dec-19	End of Operational Testing: Stage 2	Bulrush series 2 A and C cells, water sedge series 5 A and C cells	
12-Dec-19	End of Operational Testing: Stage 2	Bulrush series 1 and 3 A and C cells, water sedge series 4 and 6 A and C cells	
7-Jan-20	End of Operational Testing: Stage 3 Stagnation Testing	Water sedge cell 4A	

6.9 FREEZE-THAW TEST

A freeze-thaw test was performed on the pilot-scale CWTS to evaluate potential COPI release through a freeze-thaw cycle with the different CWTS designs. The freeze thaw test is intended to evaluate initial release of COPIs immediately upon the CWTS thawing, as the pilot-scale CWTS plants do not recover from the rapid freeze-thaw, subsequent treatment was not evaluated. In other words, the freeze-thaw test on the pilot-scale CWTS is intended to provide information on treated COPI stability and potential release through the freeze-thaw cycle, and not subsequent treatment as water flows through the CWTS. In an on site system, the CWTS would freeze in the winter months and would thaw (including clean overlying snow) in the spring, and plants would begin growing and promoting water circulation through the root zones. While the ABM lake is expected to flow year-round owing to continued Fault Creek and groundwater contributions in the winter, treatment in the CWTS through the winter months is not expected (AEG, 2018).

Freeze-thaw testing was performed on one bulrush (series 3) and one water sedge (series 6) pilot-scale system after stage 2 of the operational period (Section 6.2). This was done by moving each cell to an area outside of the testing facility to freeze in the outside temperatures of -16 to -11°C (daytime) and -29 to -22°C (nighttime) for four days. Snowfall was monitored during this period with < 1 cm of snowfall during the freezing period. Prior to moving the cells outside, water samples were collected using methods described below and were analyzed for low level total and dissolved metals, anions, alkalinity, and ammonia. Similarly, the above water plant biomass was harvested for analytical testing as described in Section 6.6 to evaluate concentration of COPI in the plant material. The organics in the water column (moss, straw, detritus) were not sampled until after the freeze-thaw trial (Section 6.6).

After the freeze period, the cells were brought back into the temperature-controlled testing facility and left to thaw at an average temperature of 18°C (Photograph 6-1). Three days after, the water columns within each cell were visually determined to have thawed throughout the entire column. Water samples were collected with clean laboratory supplied sample bottles appropriate for each analysis parameter. Sample collectors wore clean and new nitrile gloves. Bottles were capped immediately after filling. All samples were collected in labelled bottles that identified the sample location, date and time of collection, field filtering and/or preservation and analysis requested. Samples were filtered and/or preserved according to the analytical service provider's instructions (BVL). All samples were stored in coolers with freezer packs to remain cold (4°C), but not frozen, during sampling and during transport to BVL. Chain of Custody (COC) forms were completed at the time of sampling and contained all information from the sample bottle labels. COCs signed by the sampler were packed inside the coolers used to transport samples to the laboratory.

In situ water pH, specific conductance, dissolved oxygen, ORP, and temperature were measured and recorded for each cell using a YSI probe and multimeter calibrated according to the manufacturer's instructions on the morning of the sampling day.

6.10 STAGNATION TEST

Although there are no stagnation periods predicted for the influent to the CWTS for the Project based on predicted overflow from the ABM Lake Post-closure (AEG, 2018), stagnation testing was conducted on the pilot CWTS to evaluate performance under a drought scenario in a potentially warming climate. The stagnation testing was performed after stage 2 of the operational period (Section 6.2). A summary of the stagnation test is provided in Table 6-11.

Evapotranspiration rates were measured in the CWTS during the stagnation period. Total evapotranspiration from the CWTS is the combined effects of open water evaporation and plant transpiration (Beebe et al., 2014). The purpose of calculating the evapotranspiration of a CWTS is to understand the amount of water lost per day over the surface area of a wetland, which in turn can concentrate COPIs and influence the constituent load to the receiving environment.

Flow was stopped in one series from both the water sedge and bulrush systems (series 1 and 4) to undergo stagnation for 24 days. Water levels were measured daily for calculation of evapotranspiration rates and *in situ* water pH, specific conductance, dissolved oxygen, ORP, and temperature were measured and recorded weekly for each cell using a YSI probe and multimeter calibrated according to the manufacturer's instructions.

Water samples were collected from within each cell after 14 days of stagnation (mid-point of the stagnation period). Water samples were analyzed for total and dissolved metals, ammonia, alkalinity, as well as routine cations and anions.

All water samples collected through the stagnation test described here were grab sampled using clean, laboratory supplied sample bottles appropriate for each analysis parameter. Sample collectors wore clean and new nitrile gloves. Bottles were capped immediately after filling. All samples were collected in labelled bottles that identified the sample location, date and time of collection, field filtering and/or preservation and analysis requested. Samples were filtered and/or preserved according to the analytical service provider's instructions (BVL). All samples were stored in coolers with freezer packs to remain cold (4°C), but not frozen, during sampling and during transport to BVL. Chain of Custody (COC) forms were completed at the time of sampling and contained all information from the sample bottle labels. COCs signed by the sampler were packed inside the coolers used to transport samples to the laboratory.

Following the 24 day stagnation period, flow was restarted to each system at the high flow rate for each CWTS design (Table 6-4). The high flow rate was selected for testing to provide information on a worst-case scenario where a stagnation period that promotes more anoxic/reducing conditions to establish in the CWTS is followed by a high flow event which rapidly provides oxygenated water to the system. The stability of treated COPI was evaluated through this transition as fresh water flowed through the CWTS, where outflow water of each cell was collected as it overflowed into the following cell (i.e., initial first flush of water through each cell). The outflow water from each cell was analyzed for low level total and dissolved metals, anions, and alkalinity.

Subsequently, the CWTS were maintained at the high flow rate and treatment through the CWTS was evaluated on two separate testing events to evaluate post-stagnation treatment in each CWTS design. Water samples were collected from downstream to upstream (e.g., C cell to A cell) to ensure that water sampling did not affect sample collection from the downstream cell (e.g., disrupting flow rates or suspending solids). Water samples were collected from the outflow of each cell and the influent for the two post-stagnation sampling events for analysis of total and dissolved metals, as well as routine anions. Additional samples were collected at the second post-stagnation sampling event for analysis of parameters, including acidity, total suspended solids (TSS), chemical oxygen demand (COD), biological oxygen demand (BOD), dissolved organic carbon (DOC), total organic carbon (TOC), and ammonia.

Table 6-11: Summary of Stagnation Testing

Day	Date	Event
0	13-Dec-19	Start of stagnation period (influent flow stopped) and daily monitoring of water level
14	27-Dec-19	Midpoint water sample collection and <i>in situ</i> parameter testing
24	6-Jan-20	End of stagnation period and daily monitoring of water level; Flow restarted to each system at high flow rate
24-25	6-Jan-20 7-Jan-20	Outflow water from each cell collected as it overflowed into the following cell
27	9-Jan-20	Post-stagnation sampling event, water collected from outflow of each cell and <i>in situ</i> parameters tested
31	13-Jan-20	Post-stagnation sampling event, water collected from outflow of each cell and <i>in situ</i> parameters tested

6.11 DETRITUS AND ACCRETION MEASUREMENTS

Vertical accretion rate is a key factor in determining wetland stability. It is defined as the measure of accumulation from organic and mineral materials on the wetland surface, and is highly dependent on the amount of decomposed material present in the CWTS. To assess vertical accretion rates of water sedge and bulrush in the pilot-scale CWTS over time, a detritus decomposition study was conducted using dried plant material based on methodologies described in literature (Chimney and Pietro, 2006; Hammerly et al., 1989).

The following steps outline the methods for the detritus and accretion study:

- 24 bags containing 5 g of either bulrush or water sedge were submerged into the A and C cells of the corresponding plant series with control polyester filter fibre material bags to determine decomposition rates in the CWTS. The first and last cells of the CWTS were selected for comparison of decomposition rates through the series.
- Additional bags containing 3 g of either bulrush or water sedge were submerged into the A cells of the corresponding plant series with control polyester filter fibre material bags to evaluate potential variability between starting mass of plant material.
- Bags were removed from each A and C cell at specific sampling events. Three sampling events were selected for bag removal:
 - o Four weeks (29 days) after bag installation;
 - o 16 weeks months (112 days); and
 - o 28 weeks (199 days), at the end of testing.
- Once removed, material was taken from bags, rinsed, and dried according to Chimney and Pietro, 2006 and Hammerly et al., 1989. Material was then weighed to determine the change in mass from starting material.

There were no differences in the percent decomposition observed between the detritus bags placed in the influent and outflow cells of the series, or between the 5 g and 3 g mass bags. All data were therefore averaged for a given timepoint.

The difference in dry weight of plant material over time was evaluated as a representation of the amount of biomass that was decomposed. Additionally, the pilot-scale CWTS cells were cut open upon completion of pilot-scale testing and the vertical accretion was directly measured in cm by placing a ruler against the cut open cells and measuring the depth of accumulated organic and mineral materials above the initial soil level.

7 DATA ANALYSIS METHODS

7.1 PERCENT REMOVAL AND LOAD REMOVAL IN WATER

The percent removal of a COPI was calculated based on the COPI influent and outflow concentrations through each pilot-scale CWTS. The amount of each COPI treated through the pilot-scale CWTS was also calculated (load removal) over the duration of the pilot-scale trials, based on the COPI influent and outflow concentrations and flow rate in each pilot-scale CWTS.

7.2 REMOVAL RATE COEFFICIENTS

An important factor for CWTS design is the rate of treatment, also known as the removal rate coefficient (RRC). The removal rate coefficient is based on the treatability of a specific compound and the HRT of the CWTS, both of which are site-specific based on water chemistry and CWTS designs and characteristics. RRCs are developed through pilot-scale test work and refined with demonstration-scale CWTS on site (Rodgers and Castle, 2008). Once developed, the RRCs are used to size the full-scale CWTS, or predict the expected outflow concentrations of a specific COPI in a wetland of the same design based on flow rates, influent concentrations, and available footprint.

First order removal rates are often used to model treatment of COPI in a CWTS (e.g., Eggert et al., 2008; Horner et al., 2012, Lizama et al., 2011; Schwindaman et al., 2014; Spacil et al., 2011). The removal rate coefficient was calculated

for each COPI using the HRT (t), influent (C_i) and outflow (C_f) concentrations of a given COPI. The calculation for the first-order removal rate is provided in Equation 7-1. The RRC was calculated for each sampling event during the operational test period and the RRC was averaged for a given HRT period. The natural logarithm of the COPI concentration was also plotted against the HRT to evaluate the strength of the relationship for first-order removal.

$$RRC = \frac{-\ln\left(\frac{C_f}{C_i}\right)}{t}$$

Where:

RRC is the first-order removal rate coefficient for a given constituent/design

t is the hydraulic retention time

C_i is the influent concentration of the COPI

C_f is the outflow concentration of the COPI

Equation 7-1: Calculation of First-order Removal Rate Coefficient

7.3 FATE AND DISTRIBUTION

The fate and distribution of COPIs in the pilot-scale CWTS were evaluated. The amount of a COPI that was removed from the influent by each CWTS was calculated using total COPI concentrations in the influent compared to the outflows as described in Section 7.1. The concentration of a COPI from: the top 5 cm of substrate (Section 6.5); above water plant tissues (bulrush, water sedge; Section 6.6); and organics (Section 6.6) at the end of CWTS testing were used to evaluate the fate and distribution of COPI that were retained in the CWTS. The remainder of the load retained in the CWTS for each COPI was considered held in 'other' locations, including substrate deeper than 5 cm, plant roots, biofilms on the walls of the CWTS cells, and forebay straw (where applicable), which were not individually analyzed.

The amount of each COPI retained in the top 5 cm of substrate was calculated based on the change in concentration of the COPI from the start (initial) to the end of the pilot-scale trials (Section 6.5). The change in concentration was calculated when it was outside of the margin of error reported by BVL. The change in the dry weight mg/kg concentration of each COPI were then multiplied by the dry weight of the substrate that is in the top 5 cm of the CWTS to calculate the amount of COPI retained in this location.

The amount of each COPI in the above water plant biomass was calculated based on the dry weight mg/kg concentration of each COPI, multiplied by the dry weight of the above water biomass that was collected at the end of the pilot-scale trials (Section 6.6). Similarly, the amount of each COPI in the organics in the water column was calculated based on the dry weight mg/kg concentration multiplied by the dry weight of the organics collected at the end of the pilot-scale trials (Section 6.6). The dry weight of both plant and organic samples was calculated using the wet weight of samples and the percent moisture data.

7.4 FREEZE-THAW TEST

The amount of a COPI that was released through the freeze-thaw test (Section 6.9) was calculated based on the difference in dissolved concentration of each COPI in the water before and after the freeze-thaw test, multiplied by the water volume in each cell. This amount was then used with the load of a given COPI retained in each CWTS series through the pilot-scale trials (Section 7.1) to calculate the percent load of each COPI released and correspondingly retained through the freeze-thaw testing.

8 RESULTS AND DISCUSSION

8.1 PLANT ESTABLISHMENT THROUGH CWTS COMMISSIONING AND OPERATION

During the commissioning period, plant health was monitored to evaluate commissioning progress, as well as to assess timelines needed to commission the system. In addition to achieving conceptual *in situ* explanatory parameter targets presented in Section 8.2 and Table 8-1, a commissioning target of a 50% increase in plant growth density from the time of planting (i.e. a 50% increase of four stems per treatment cell would be six stems per cell) was established. A 50% increase in plant density was successfully achieved by the end of commissioning compared to the beginning of commissioning for both bulrush and water sedge. Photograph 8-1 to Photograph 8-5 show the pilot-scale systems over time and establishment of moss in the CWTS.

8.2 EXPLANATORY PARAMETERS

Explanatory parameters are quantifiable metrics of a CWTS environment that can be used to assess commissioning progress and determine what treatment processes are likely occurring in the CWTS. Certain parameters, such as dissolved oxygen, oxidation-reduction potential, and soil redox, are useful *in situ* parameters to understand conditions in a CWTS environment. Theoretical targets for these *in situ* parameters are defined at the start of a pilot-scale CWTS trial based on literature and previous CWTS experience for anaerobic designs (Table 8-1). The theoretical targets are then used to guide decisions during CWTS commissioning while the system is establishing, before other water quality parameters are routinely monitored through operational testing. The theoretical targets are then refined through the pilot-scale trials to provide operational criteria for the CWTS based on water quality monitoring and treatment performance that is observed in the system.

During commissioning of the CWTS, the *in situ* measurements for dissolved oxygen, oxidation-reduction potential, and soil redox were compared to the theoretical targets to evaluate system commissioning (Table 8-1). The water sedge CWTS had DO, ORP, and soil redox measurements in the theoretical target range by the end of the commissioning period. The bulrush CWTS had dissolved oxygen and oxidation reduction potential measurements above the theoretical targets, while the soil redox was consistently achieving the theoretical target suggesting reducing conditions were established in the substrate. The commissioning period transitioned to the operational test period on May 17, 2019 based on plant establishment (Section 8.1) and reducing conditions in the substrate of both pilot-scale CWTS designs (Table 8-1).

Table 8-1: *In Situ* Explanatory Parameter Measurements in the CWTS at the End of Commissioning and Theoretical Targets

Plant Type	Parameter		Theoretical Target ¹	Measurements ²					Average
				25-Apr-19	01-May-19	06-May-19	09-May-19	14-May-19	
Bulrush	Water	DO (mg/L)	<2.0	3.88	3.30	4.48	3.37	4.29	3.86
		ORP (mV)	<50	92.5	133.9	114.0	74.0	79.3	98.7
	Substrate	Soil Redox (mV)	<-50	-54.2	-89.9	-96.9	-100.4	-92.8	-86.8
Water Sedge	Water	DO (mg/L)	<2.0	0.40	0.71	0.71	0.83	N/A	0.66
		ORP (mV)	<50	-89.4	26.2	-24.0	-36.5	N/A	-30.9
	Substrate	Soil Redox (mV)	<-50	-125.6	-143.8	-136.7	-143.7	N/A	-137.5

DO – Dissolved Oxygen; ORP – Oxidation-Reduction Potential.

N/A – Not measured at this timepoint.

¹ Theoretical target based on literature and previous CWTS experience, used to guide decisions and monitor commissioning.

² Average of all cells in series 1, 2 & 3 for bulrush and series 4, 5 & 6 for water sedge.

During the commissioning and operational test periods the bulrush CWTS typically had DO measurements > 2.0 mg/L (Figure 8-1; Appendix A, Table A1-1). In contrast, the water sedge CWTS had decreasing DO values through commissioning, and typically had DO concentrations < 2 mg/L through later stages of commissioning and through the operations period until the final phase of testing (high flow during operational stage 2 testing) where DO concentrations increased slightly above 2 mg/L. Treatment of COPIs was more efficient in the water sedge systems (Section 8.3) indicating that the theoretical target DO concentration of < 2 mg/L is favourable for treatment. Variability in DO concentrations was observed during the stagnation period in both CWTS designs, with high values measured at the mid

point of the stagnation period which corresponded to the water sampling event (Figure 8-1 and Figure 8-2). Low DO concentrations were observed in the cells following the freeze-thaw test (Figure 8-1 and Figure 8-2).

Grey shading with “S/F” indicates the stagnation (series 4) or freeze trial (series 6) periods. Theoretical DO target of < 2 mg/L shown with dotted line.

The ORP measurements for the bulrush CWTS design were typically greater than +50 mV through the duration of the pilot-scale trials (Table 8-1, Figure 8-3; Appendix A, Table A1-1). In comparison, the water sedge CWTS design had ORP measurements that ranged from – 50 mV to + 200 mV through the commissioning and operational testing periods, with measurements consistently lower than the bulrush CWTS design (Figure 8-4; Appendix A, Table A1-1). ORP measurements are best used as a rapid qualitative guide in the context of CWTS conditions, with redox-active species (iron and manganese) and their relative trends providing a more precise indicator of conditions that are conducive to the target treatment mechanisms. The concentrations and trends of redox-active constituents and their relative position in the redox ladder were therefore also evaluated (discussed below). Based on treatment of COPs observed in the water sedge systems (summarized in Section 8.3), the operational range for ORP in the water sedge CWTS is broader than the theoretical target that was defined at the start of the trials.

A decrease in ORP measurements was observed during the stagnation period and through the freeze-thaw test event in both CWTS designs, with the exception of an increased measurement at the mid point of the stagnation period which corresponded to the water quality sampling event where grab samples were collected from within the cell rather than collected from the outflow, as the system was not flowing (Figure 8-3 and Figure 8-4; Section 6.10).

Figure 8-3: Water Oxidation-reduction Potential Over Time in the Bulrush CWTS

Blue shading indicates the commissioning period. Green shading with "L" indicates low flow period. Yellow shading with "M" indicates medium flow period. Red shading with "H" indicates high flow period. Period with "*" indicates stage 2 operational period where series 2 was in very low flow testing. Grey shading with "S/F" indicates the stagnation (series 1) or freeze trial (series 3) periods. Theoretical ORP target of < 50 mV shown with dotted line. Fluctuations in influent ORP likely due to variations in concentrations of the major redox couple(s) to which the ORP electrode responds.

Fluctuations in influent ORP likely due to variations in concentrations of the major redox couple(s) to which the ORP electrode responds.

Soil redox typically remained below -50 mV in most cells throughout the commissioning and operational periods in both the bulrush and water sedge CWTS regardless of the flow period (Figure 8-5 and Figure 8-6, respectively; Appendix A, Table A1-1). Measurement of soil redox continued through the stagnation period, with measurements remaining stable in all except for a temporary increase in cell 5B (Figure 8-5 and Figure 8-6). Soil redox measurements after the freeze-thaw test event increased, however, this may be due to displacement of soil redox probes through the freeze-thaw cycle (Figure 8-5 and Figure 8-6).

Figure 8-5: Soil Redox Over Time in the Bulrush CWTS

The concentration and trends of redox-active constituents such as iron and manganese were also evaluated to provide insight on conditions within the CWTS (Section 3.5). Manganese and iron are commonly held in the substrate as (hydr)oxides, the development of more reducing conditions often results in their transient release as the host phases are dissolved under manganese- and iron- reducing conditions. Dissolved iron consistently increased through the CWTS in all flow periods in all water sedge systems and dissolved manganese had slight increases in lower flow periods (Figure 8-7 and Figure 8-8). The variability of dissolved iron concentrations that were observed across timepoints in the CWTS is likely due to the low concentrations and rapid oxidation/precipitation kinetics of dissolved iron that are observed at the circumneutral pH of the trials. The increases in dissolved manganese and iron concentrations are indicative of reducing conditions in the water sedge CWTS. In contrast, the bulrush CWTS had little or no increase in dissolved iron and manganese (Figure 8-7 and Figure 8-8). Overall, this suggests that throughout operations the water sedge CWTS was at or below the iron reducing stage on the redox ladder (redox ladder background provided in Section 3.5) and overall promoted a more reducing environment than the bulrush systems.

Although some iron and manganese mobilization was observed in the water sedge systems, the concentrations were approximately one order of magnitude below their respective WQOs for KZ-37 (Figure 8-8 and Figure 8-9). Ferrous iron released from the CWTS is expected to rapidly oxidize and precipitate at the circumneutral, well oxygenated waters of Geona Creek, while dilution downstream of the CWTS will further lower the concentrations of iron and manganese. As such, the transient mobilization of iron and manganese observed in the pilot CWTS are not expected to result in elevated iron and manganese concentrations downstream at KZ-37.

Figure 8-7: Average Dissolved Iron Concentrations for Both Constructed Wetland Treatment System Designs During Each Flow Period

Replicate CWTS designs are grouped and averaged. Treatment period identified by targeted flow and HRT. Treatment cell in CWTS identified by shape: A Cell (triangle), B Cell (square), C Cell (circle). The error bars indicate the lowest and highest concentrations in each cell for each flow period. The detection limit for dissolved iron was 0.00002 mg/L.

The error bars indicate the lowest and highest concentrations in each cell for each flow period. The detection limit for dissolved manganese was 0.00050 mg/L. The lower limit of the receiving environment WQO is indicated with a dotted line (0.432 mg/L).

Figure 8-9: Average Total Iron Concentrations for Both Constructed Wetland Treatment System Designs During Each Flow Period

Replicate CWTS designs are grouped and averaged. Treatment period identified by targeted flow and HRT. Treatment cell in CWTS identified by shape: A Cell (triangle), B Cell (square), C Cell (circle). The error bars indicate the lowest and highest concentrations in each cell for each flow period. The detection limit for total iron was 0.00002 mg/L. The receiving environment WQO is indicated with a dotted line (0.687 mg/L). Predicted total concentrations are 0.01 mg/L (Table 4-2).

Other *in situ* parameters that were monitored in the water of the CWTS included temperature, specific conductivity (SPC), and pH. The average water temperature was higher during early commissioning attributed to higher temperature targets during early commissioning to expedite plant growth (Section 6.1). The temperature setpoint was decreased for the last two months of commissioning and the first stage of operations, and the temperature varied based on external seasonal temperature fluctuations. On October 15, 2019, the internal temperature of the pilot-scale facility was set to 21°C during the day and 14°C at night to mimic July temperatures (data from the National Climate Archives at Faro, Yukon). This, combined with gradually decreasing external seasonal influences of temperature led to a decrease in water temperatures during the second half of pilot-scale testing (Figure 8-10 and Figure 8-11). Temperatures during stagnation were consistent with those observed in later pilot-scale testing, while the temperature of cells upon thawing after the freeze-thaw trial were 7°C to 11°C.

Figure 8-10: Temperature Over Time in the Bulrush CWTS

Blue shading indicates the commissioning period. Green shading with “L” indicates low flow period. Yellow shading with “M” indicates medium flow period. Red shading with “H” indicates high flow period. Period with “*” indicates stage 2 operational period where series 2 was in very low flow testing. Grey shading with “S/F” indicates the stagnation (series 1) or freeze trial (series 3) periods.

Figure 8-11: Temperature Over Time in the Water Sedge CWTS

Blue shading indicates the commissioning period. Green shading with “L” indicates low flow period. Yellow shading with “M” indicates medium flow period. Red shading with “H” indicates high flow period. Period with “*” indicates stage 2 operational period where series 5 was in very low flow testing. Grey shading with “S/F” indicates the stagnation (series 4) or freeze trial (series 6) periods.

The SPC in the CWTS remained relatively stable through the commissioning and operational period following the introduction of synthetic water to the pilot-scale systems (March 5, 2019; Figure 8-12 and Figure 8-13), except for during the very low flow period where an increase in SPC (particularly in water sedge CWTS) was observed. This increase was likely a result of evapotranspiration (water loss concentrating constituents; Section 8.3.1). The SPC during the stagnation and freeze-thaw trials were also higher than observed during operations.

Figure 8-12: Specific Conductivity Over Time in the Bulrush CWTS

Blue shading indicates the commissioning period. Green shading with “L” indicates low flow period. Yellow shading with “M” indicates medium flow period. Red shading with “H” indicates high flow period. Period with “*” indicates stage 2 operational period where series 5 was in very low flow testing. Grey shading with “S/F” indicates the stagnation (series 4) or freeze trial (series 6) periods.

The pH decreased in the CWTS gradually through commissioning, particularly following the introduction of synthetic water into the systems on March 5, 2019 (Figure 8-14 and Figure 8-15). During early commissioning, there was a brief decrease in influent pH observed due to a decrease in alkalinity in the tap water used to create the synthetic influent. The synthetic influent was subsequently adjusted to achieve target pH of 7-8. Despite variation in the influent pH, the pH remained stable throughout the pilot-scale testing period with the water sedge CWTS having a slightly lower pH than bulrush CWTS (Figure 8-14 and Figure 8-15). During stagnation, pH measurements increased slightly and were similar to the influent pH. Changes in influent pH did not appear to significantly affect COPI concentrations in the influent water, which remained relatively stable throughout the test work (Appendix A, Table A4-1).

During the operating phase, the pH of the bulrush and water sedge CWTS (approximately 6.3 to 7.0) was lower than the influent water (approximately 6.9 to 8.0). This is likely due to carbon dioxide oversaturation from mineralization of organic carbon under the reducing conditions in the CWTS. The slightly lower pH observed for the water sedge than the bulrush CWTS likely reflects the stronger reducing conditions observed for the water sedge system (Figure 8-3 and Figure 8-4) and associated greater carbon mineralization. Degassing of carbon dioxide will occur as the water discharged from the CWTS equilibrates with the atmosphere, which will cause the pH to rise. Therefore, perturbations to the circumneutral pH waters of Geona Creek are not expected from upstream operation of a CWTS.

Blue shading indicates the commissioning period. Green shading with "L" indicates low flow period. Yellow shading with "M" indicates medium flow period. Red shading with "H" indicates high flow period. Period with "*" indicates stage 2 operational period where series 5 was in very low flow testing. Grey shading with "S/F" indicates the stagnation (series 4) or freeze trial (series 6) periods.

8.3 TREATMENT OVERVIEW

The Removal Rate Coefficient (RCC) is assessed through pilot-scale testing, and is based on the treatability of a specific COPI and the Hydraulic Retention Time (HRT) of the system, both of which are site-specific based on water chemistry, wetland design, and characteristics (Section 7.2). As such, RCC must be developed in a site-specific manner for each COPI.

The RCCs presented in this report are a representative approximation for the predicted “worst case” scenario overflow from the ABM Lake (Table 4-2). Each CWTS design was tested for the ability to treat COPIs (antimony, arsenic, cadmium, copper, lead, selenium, uranium, and zinc) through conversion of dissolved metal and metalloid fractions in the water to less bioavailable and filterable forms, through microbial reduction, and/or through nutrient uptake.

The average RCCs in days⁻¹ for each COPI in the two CWTS designs are presented in Table 8-2, along with the proxy RCCs used to develop the initial CWTS size estimates for the Project (Section 3.2; AEG, 2017a) and pilot-scale testing plan. RCCs in the water sedge CWTS were generally higher than RCCs from the bulrush CWTS. Similarly, RCCs developed through the pilot-scale test work with the water sedge CWTS design were typically higher than the proxy RCCs previously used. Removal rate coefficients calculated for each sampling event are presented in Appendix A (Table A2-1 and Table A2-2).

The bulrush systems received a higher load of COPIs than the water sedge systems based on a higher flow rate in the bulrush to obtain the same HRT across both designs. This is because bulrush has a greater water depth tolerance compared to water sedge. Therefore, the load removed per day (presented in the subsequent sections) reflects the overall load that entered the system.

The treatment of each COPI, percent removal, and RCCs are discussed in detail in the following COPI sections (Sections 8.4.1 through 8.4.3). The effect of stagnation and freeze-thaw testing periods for each CWTS design are also described, along with the fate, distribution, and stability of treated COPIs.

Table 8-2: Average Removal Rate Coefficients for Constituents of Potential Interest Based on Pilot-scale Constructed Wetland Treatment System Testing (day⁻¹)

COPI	Bulrush CWTS	Water Sedge CWTS	Proxy
Antimony	0.02314	0.133	--
Arsenic	0.0766	0.300	0.077
Cadmium	0.399	0.989	0.48
Copper	0.611	0.813	0.48
Lead	1.490	1.501	0.723
Selenium	0.0439	0.271	0.456
Uranium	0.121	0.361	--
Zinc	0.123	0.508	0.48

'--' no proxy rate removal coefficient available. Sources for proxy removal rate coefficients are in Table 3-4.

All removal rate coefficients are first order (day⁻¹). All COPIs use dissolved concentrations for removal rate coefficient calculations rather than total concentrations as dissolved values are more representative of targeted treatment through transformation and transfer from the CWTS water. Removal rate coefficients calculated for each sampling event are presented in Appendix A (Table A2-1 and A2-2).

8.3.1 EVAPOTRANSPIRATION

Evapotranspiration was measured in the CWTS during stagnation testing by daily measurement of the water levels in the stagnating cells as described in Section 6.10. The results revealed differences between bulrush and water sedge CWTS rates of water loss, with more water loss from water sedge (7.7 L/day/m²) than bulrush (2.3 L/day/m²) (Figure 8-16; Appendix A, Table A3-1). The higher evapotranspiration rate in the water sedge is likely due to more biomass in those systems compared to the bulrush. The evapotranspiration differences were largest in water sedge during the low flow and very low flow periods, when 27% and 43% of the water entering the CWTS was lost to evapotranspiration, respectively. This resulted in the concentration of COPIs and subsequently higher outflow concentrations. Once corrected for evapotranspiration, the percent removals during very low flow resemble that of the corrected low flow testing period. Water loss through evapotranspiration is an important factor for CWTS sizing, and is intended to be further refined through on site testing in the presence of multiple climatic variables that will ultimately impact evapotranspiration rates in the full-scale CWTS.

Figure 8-16: Water Loss (L/day/m²) from Stagnating Cells in Bulrush and Water Sedge CWTS

Bulrush cells: 1A, 1B, 1C; Water Sedge cells: 4A, 4B, 4C

8.4 METAL AND METALLOID CONSTITUENTS OF POTENTIAL INTEREST

The treatment of several COPs in this group was very similar, particularly cadmium, copper, and lead, which will be discussed together (Section 8.4.1). Arsenic, antimony, and zinc also exhibited generally similar treatment (Section 8.4.2). Selenium and uranium treatment are discussed together as they are directly reduced by microbes (Section 8.4.3).

8.4.1 CADMIUM, COPPER, AND LEAD

8.4.1.1 Treatment Evaluation

The average concentrations of dissolved cadmium, and total lead entering the CWTS remained stable throughout the pilot-scale trials (average of 0.0020 mg/L and 0.022 mg/L, respectively; Table 4-2; all measurements in Appendix A, Table A4-1). Dissolved and total concentrations for cadmium and copper were similar throughout CWTS testing, while lead was predominantly measured as total lead (Appendix A, Table A4-1). The concentrations of cadmium and lead in the influent were equivalent to the 2018 “worst case” water quality model (WQM) predicted concentrations (Table 4-2). Copper influent concentrations were higher than the 2018 “worst case” WQM targets due to elevated levels in the tap water, and were on average 0.025 mg/L dissolved copper (Table 4-2). This is not expected to impact testing or development of a site specific removal rate coefficient for copper (Chapter 4).

Both water sedge and bulrush designs exhibited substantial dissolved cadmium removal, with consistent treatment to below the receiving environment WQO (0.000377 mg/L to 0.000456 mg/L) except for the bulrush CWTS during the high flow test periods (1.5-day HRT) and one point each in medium and low flow testing events (Table 8-3). The water sedge CWTS exhibited higher percent removal (92% to greater than 99%) of dissolved cadmium in all flow periods compared to the bulrush CWTS (55% to 93%; Table 8-3, Figure 8-17).

Table 8-3: Dissolved Cadmium Treatment Summary Through Pilot-scale Constructed Wetland Treatment System Testing Periods

Summary (Average)	Bulrush				Water Sedge			
	Very Low	Low	Medium	High	Very Low	Low	Medium	High
Influent (mg/L) ¹	0.00204	0.00203	0.00199	0.00197	0.00204	0.00203	0.00199	0.00197
Outflow (mg/L) ₁	0.00019	0.00011	0.00019	0.00088	0.00001	0.00001	0.00002	0.00016
% Removal ²	91%	93%	90%	55%	>99%	>99%	99%	92%
Load Removed (mg/day) ³	0.03	0.06	0.17	0.35	0.02	0.04	0.11	0.33

Period identified by flow where: Very low flow: 25-day HRT; low flow: 16-day HRT; medium flow: 5-day HRT; high flow: 1.5-day HRT.

Green shading indicates concentrations were at or below the lower limit of the receiving environment WQO (0.000377 – 0.000456 mg/L). The detection limit was 0.0000050 mg/L.

¹ Averages calculated using results from all sampling events at a given flow period (e.g. 5-day HRT for medium flow testing is average of 6 sampling events). Raw data can be found in Appendix A, Table A4-1.

² % removal calculated for each sampling event based on influent and outflow concentrations and then averaged for each flow testing period. % removal has not been corrected for water loss through evapotranspiration.

³ Load removed calculated for each sampling event based on influent and outflow concentrations and volume of water through the system and then averaged for each flow testing period.

Figure 8-17: Average Dissolved Cadmium Concentrations for Both Constructed Wetland Treatment System Designs During Each Flow Period

Replicate CWTS designs are grouped and averaged. Treatment period identified by targeted flow and HRT. Treatment cell in CWTS identified by shape: A Cell (triangle), B Cell (square), C Cell (circle). The error bars indicate the lowest and highest concentrations in each cell for each flow period. The detection limit for dissolved cadmium was 0.0000050 mg/L. The lower limit of the receiving environment WQO is indicated with a dotted line (0.000377 – 0.000456 mg/L).

Copper also displayed significant treatment in both CWTS designs during all flow periods, with greater than 92% removal in the water sedge and greater than 82% removal in the bulrush systems (Table 8-4). Dissolved copper concentrations in the synthetic water varied as concentrations in the tap water varied (Figure 8-18). The water sedge design achieved dissolved copper concentrations below the receiving environment WQO (0.00144 mg/L) during the medium flow (5-day HRT), low flow (16-day HRT), and very low flow periods (25-day HRT), and was close to the receiving environment WQO during the high flow (1.5-day HRT) period (Table 8-4 and Figure 8-18). The bulrush CWTS design did not achieve dissolved copper concentrations below the WQO during any flow period (Table 8-4, Figure 8-18).

Table 8-4: Dissolved Copper Treatment Summary Through Pilot-scale Constructed Wetland Treatment System Testing Periods

Summary (Average)	Bulrush				Water Sedge			
	Very Low	Low	Medium	High	Very Low	Low	Medium	High
Influent (mg/L) ¹	0.0170	0.0152	0.0192	0.0303	0.0170	0.0152	0.0192	0.0303
Outflow (mg/L) ¹	0.0023	0.0024	0.0019	0.0034	0.0002	0.0004	0.0006	0.0021
% Removal ²	87%	82%	90%	88%	99%	97%	97%	92%
Load Removed (mg/day) ³	0.32	0.44	1.69	8.49	0.23	0.32	1.04	5.05

Period identified by flow where: Very low flow: 25-day HRT; low flow: 16-day HRT; medium flow: 5-day HRT; high flow: 1.5-day HRT.

Green shading indicates concentrations were at or below the receiving environment WQO (0.00144 mg/L). The detection limit was 0.000050 mg/L.

¹ Averages calculated using results from all sampling events at a given flow period (e.g. 5-day HRT for medium flow testing is average of 6 sampling events). Raw data can be found in Appendix A, Table A4-1.

² % removal calculated for each sampling event based on influent and outflow concentrations and then averaged for each flow testing period. % removal has not been corrected for water loss through evapotranspiration.

Figure 8-19: Average Total Lead Concentrations for Both Constructed Wetland Treatment System Designs During Each Flow Period

Replicate CWTS designs are grouped and averaged. Treatment period identified by targeted flow and HRT. Treatment cell in CWTS identified by shape: A Cell (triangle), B Cell (square), C Cell (circle). The error bars indicate the lowest and highest concentrations in each cell for each flow period. The detection limit for total lead was 0.000020 mg/L. The lower limit of the receiving environment WQO is indicated with a dotted line (0.012 – 0.017 mg/L).

The water sedge design had a much higher RRC for cadmium (faster treatment) compared to the bulrush (Table 8-2). Copper treatment was also better in the water sedge compared to the bulrush, while treatment of lead was similar between the two designs with no notable difference between the RRCs (Table 8-2).

8.4.1.2 Fate, Distribution, and Stability

The fate and distribution of cadmium, copper, and lead removed from the water during pilot-scale testing (including commissioning) were evaluated for each CWTS design (Section 7.3). The concentration of each COPI was measured at the end of the pilot-scale trials in the top ~5 cm of substrate, the above water plant tissues, and the organic material in the water column of the cell (moss, straw, and duckweed). The wet mass of plant tissue and organic material collected during the final sampling event (Appendix A, Table A5-1) and the percent moisture (Appendix A Table A5-2) were used alongside COPI concentrations in the plant and organic material (Appendix A, Table A5-3) to estimate the load of each COPI in the plant or organic material at the end of the pilot-scale trials. This was similarly done to estimate the load of each COPI in the top ~5 cm of substrate (Appendix A, Table A6-1). The distribution of the COPI in the pilot CWTS was then evaluated, with load retained in 'other' locations within the CWTS cells which were not measured including substrate deeper than 5 cm, plant roots, biofilms on the walls of the CWTS cells, and forebay straw (where applicable).

Of the load of cadmium that entered the series through the pilot-scale test work, 0.014 to 0.026 grams (g) of cadmium was retained (Table 8-6), which corresponds to 76% to 84% and 95% to 98% of the load that entered the CWTS retained in each of the bulrush and water sedge CWTS, respectively (Table 8-6). For copper, 0.146 to 0.389 g was retained, which corresponds to 82% to 84% and 93% to 95% of the load that entered the CWTS retained in each of the bulrush and water sedge CWTS, respectively. For lead, 0.148 to 0.344 g of lead was retained, which corresponds to 99% of the load that entered the CWTS retained in all series (Table 8-6).

Of the load that entered each series, the distribution of that load into the top ~5 cm of substrate, the above water plant tissues, and the organic material in the water column of the cell was evaluated. Cadmium, copper, and lead concentrations in the top 5 cm of substrate at the end of the pilot-scale trials were within method accuracy of the respective starting substrate concentrations (Appendix A, Table A6-1).

There were low concentrations of copper, lead, and cadmium in both plant types as targeted (Appendix A, Table A5-3), with less than 1% of the load retained in the bulrush and less than 1.1% of the load retained in the water sedge tissues (Table 8-6).

In the bulrush CWTS design, organics in the water column accounted for 13% to 57% of the retained cadmium, copper, and lead. In the water sedge CWTS design, organics in the water column accounted for 4% to 17% of the retained cadmium, copper, and lead (Table 8-6). The variability in load retained in the organics within each series is partially explained by the amount of organics that were present in each cell by the end of the pilot-scale trials (Appendix A, Table A5-1), while the bulrush series also demonstrated more variability in COPI concentration in the organics in each a series (particularly for cadmium and copper; Appendix A, Table A5-3). A comparison of bulrush and water sedge reveals more cadmium, copper, and lead retention in the organics in the bulrush compared to the water sedge CWTS, which was likely due to more moss in the bulrush CWTS.

The remainder of the retained cadmium, copper, and lead was therefore in the deep substrate/roots zone and 'other' locations described above for both designs (43% to 87% and 83% to 96% for bulrush and water sedge, respectively; Table 8-6). Storage of COPIs in areas such as the root zone and deeper substrate provides stability to the COPI as well as being buried over time through accretion. Based on the complexity of treatment wetland systems, it is common to encounter components of the mass balance that are not accounted for (Kadlec and Wallace, 2009).

Table 8-6: Load of Copper, Cadmium, and Lead Retained and Percent Distribution Within the CWTS

Series	Load Retained (g)	Load Retained (%) ¹	Percent of Load Retained (%) ²			
			Top 5 cm Substrate ³	Above Water Plant Tissue ⁴	Organics in Water Column ⁵	Deep Substrate/Root Zone & Other ⁶
Cadmium						
Bulrush 1	0.025	76	NM	0.0	57	43
Bulrush 2	0.019	87	NM	0.0	26	74
Bulrush 3	0.026	84	NM	0.1	18	82
Water Sedge 4	0.020	95	NM	0.4	4.0	96
Water Sedge 5	0.014	97	NM	0.1	9.8	90
Water Sedge 6	0.019	98	NM	0.2	17	83
Copper						
Bulrush 1	0.389	82	NM	0.1	54	46
Bulrush 2	0.189	84	NM	0.1	30	70
Bulrush 3	0.297	84	NM	0.2	19	80
Water Sedge 4	0.288	93	NM	1.0	3.8	95

Water Sedge 6	0.219	94	NM	1.1	14	85
Lead						
Bulrush 1	0.344	99	NM	0.0	31	69
Bulrush 2	0.235	99	NM	0.0	13	87
Bulrush 3	0.317	99	NM	0.1	18	82
Water Sedge 4	0.220	99	NM	0.2	4.9	95
Water Sedge 5	0.148	99	NM	0.3	6.0	94
Water Sedge 6	0.206	99	NM	0.3	12	88

NM: Not measurable (final concentrations of COPs were within method error of initial concentrations. Method error was 20% for initial and 30% for final samples).

¹ Calculated by dividing the load retained (g) by the load in (g) over the entire pilot trial. Load in varies based on the retention time of each series.

² Calculated by dividing the load retained in respective area of the CWTS by the overall load retained for each series.

³ Top 5 cm of substrate collected from each CWTS cell.

⁴ All above water plant tissue collected from each CWTS cell.

⁵ Organic material in water column including moss, straw, and duckweed collected from each CWTS cell.

⁶ Percent retained in the 'other' category is the remaining load retained that was not accounted for by the top 5 cm substrate, above water plant tissue, and organic material in water column. This includes deeper substrate, plant roots, biofilms on the walls of the CWTS cells, and forebay straw (where applicable).

Copper in the top 5 cm of substrate was predominantly associated with the sulphide- and/or organic-bound (Fraction 4) or residual mineral (Fraction 5) form in all systems (Figure 8-20; Appendix A, Table A6-2). The amount of copper in Fraction 4 increased through the pilot-scale tests (compared to the initial distribution where there was no copper in Fraction 4). The increase in Fraction 4 was accompanied by a decrease in the iron and manganese oxide-bound form (Fraction 3). This likely reflects reductive dissolution of a portion of the copper-bearing iron (oxyhydr)oxides and re-precipitation of the released copper as a sulphide phase, either as a discrete copper sulphide or co-precipitated with iron sulphide, and/or bound to organics. It is notable that the water sedge systems contained greater amounts of copper in Fraction 4 than the bulrush systems, suggesting that the more reducing conditions in the water sedge systems led to copper being in a stable form in these systems. Copper extracted in Fraction 5 is expected to be stable within the CWTS substrate since strong acids are required to liberate this copper in the Tessier extraction scheme. Similarly, copper

present in Fraction 4 is also expected to be stable within the CWTS since strongly oxidizing conditions are required to release this copper whereas reducing conditions are sustained within the CWTS. Deposition and burial of copper sulphides associated with Fraction 4 within the CWTS will further lower their potential for interaction with more oxidizing waters and provide long term sequestration within the CWTS.

Figure 8-20: Fraction Distribution of Copper in the CWTS Pilot Design Expressed as a % of the sum From Tessier Extractions (Top) and as mg/kg (Bottom)

Results of Tessier sequential extraction determining mineral forms of copper in the top 5 cm of substrate. Whited out areas are values at or below detection limits.

Cadmium and lead influent concentrations into the CWTS were too low to evaluate any notable changes in form associated with the substrate. The starting substrate was predominantly below detection limits for the sequential Tessier extraction. However, lower detection limits were available for the testing performed at the end of the pilot-scale trials. These lower detection limits enabled some interpretation of the Fractions. Cadmium was largely distributed between Fractions 2 and 3 (Figure 8-21). Fraction 1 generally accounted for 10% to 15% of the cadmium inventory, although a higher proportion (approximately 30%) was observed in samples 3A, 4A, and 6A. These data indicate that cadmium is largely bound with carbonate (Fraction 2) and iron and/or manganese (oxyhydr)oxide (Fraction 3) phases. Cadmium readily forms carbonate minerals and can substitute for calcium within calcite. Given that acidic influent to the field CWTS is not anticipated, cadmium sequestered in carbonate minerals is expected to be stable within the CWTS. Furthermore, the alkalinity produced by the reducing reactions within the CWTS will contribute to cadmium removal in carbonate form and foster the stability of such carbonate minerals. Although a portion of the poorly crystalline iron and manganese (oxyhydr)oxides within the CWTS will undergo reductive dissolution, the subsequent elevated dissolved ferrous iron concentrations tend to promote recrystallization of such minerals to form more crystalline iron (oxyhydroxides such as goethite and lepidocrocite), for which cadmium has a strong affinity. Cadmium associated with such phases is expected to be stable, and cadmium released following reductive dissolution of its manganese or iron (oxyhydr)oxide host will likely be re-precipitated as a sulphide phase under sulphate-reducing conditions within the CWTS. Although the elevated Fraction 1 cadmium content found for some samples may suggest potential for desorption, it should be noted that the 1 molar (M) magnesium chloride solution used for this extraction step has an ionic strength that is much higher than the freshwaters expected to feed the CWTS in the field, and so represents a conservative bound for cadmium desorption. It is expected that cadmium released in this fashion would be available for re-precipitation within carbonate and/or sulphide phases in the CWTS. No marked difference in the cadmium distribution across the Tessier fractions was observed between the bulrush and water sedge experiments, apart from a slightly higher proportion of Fraction 4 associated cadmium in the water sedge substrate, consistent with the more reducing conditions observed for these systems.

Figure 8-21: Fraction Distribution of Cadmium in the CWTS Pilot Design Expressed as a % of the sum From Tessier Extractions (Top) and as mg/kg (Bottom)

Results of Tessier sequential extraction determining mineral forms of cadmium in the top 5 cm of substrate. Whited out areas are values at or below detection limits.

Approximately 80% to 90% of the lead in the CWTS substrate was extracted with the residual Fraction 5 (Figure 8-22). This indicates that the lead is primarily stored as a recalcitrant mineral form that is resistant to solubilization and is expected to remain stably sequestered within the CWTS following removal from solution. No marked change in lead distribution across the Tessier extraction pools was noted in the substrate collected from the bulrush and water sedge systems, except for cell 4A, which had the highest Fraction 2 and 4 proportions (7% and 6%, respectively). This may be related to the strong reducing condition of this cell, resulting in lead removal in carbonate and sulphide forms associated with Fractions 2 and 4, respectively.

Figure 8-22: Fraction Distribution of Lead in the CWTS Pilot Design Expressed as a % of the sum From Tessier Extractions (Top) and as mg/kg (Bottom)

Results of Tessier sequential extraction determining mineral forms of lead in the top 5 cm of substrate. Whited out areas are values at or below detection limits.

8.4.1.3 Freeze-thaw Testing

A freeze-thaw test was performed on the pilot-scale CWTS to evaluate potential COPI release through a freeze-thaw cycle with the different CWTS designs. The freeze thaw test was intended to evaluate initial release of COPIs immediately upon the CWTS thawing; as the pilot-scale CWTS plants do not recover from the rapid freeze-thaw, subsequent treatment was not evaluated. In other words, the freeze-thaw test on the pilot-scale CWTS is intended to provide information on treated COPI stability and potential release through the freeze-thaw cycle, and not subsequent treatment as water flows through the CWTS. In an on site system, the CWTS would thaw (including clean overlying snow) and plants would begin growing in the spring, promoting water circulation through the root zones and treatment of COPIs.

The cadmium, copper, and lead that was retained in the CWTS remained predominantly stable through a freeze-thaw process (Table 8-7). Over 97% of the load of cadmium and copper stored in the CWTS through the pilot-scale trials was retained through the freeze-thaw testing, and over 99% of the load of lead. The water sedge CWTS design had a greater percent of cadmium and copper retained in the CWTS through the freeze-thaw trial than the bulrush CWTS design.

Table 8-7: Load of Cadmium, Copper, and Lead Released and Percent Retained Through Freeze-Thaw Testing.

COPI	Pilot-scale CWTS	Load retained (g)	Load released through freeze-thaw (g)	Percent retained
Cadmium	Bulrush (series 3)	0.026	0.0009	97%
	Water sedge (series 6)	0.019	0.0002	99%
Copper	Bulrush (series 3)	0.297	0.010	97%
	Water sedge (series 6)	0.219	0.004	98%
Lead	Bulrush (series 3)	0.317	0	> 99%
	Water sedge (series 6)	0.206	0	> 99%

8.4.1.4 Stagnation Testing

Although there are no stagnation periods predicted for the influent to the CWTS for the Project based on predicted overflow from the ABM Lake Post-closure (AEG, 2018), stagnation testing was conducted on the pilot CWTS to evaluate performance under a drought scenario in a potentially warming climate. After the stagnation period, water was flowed through the pilot-scale CWTS at the high flow rate for each respective series (Section 6.10). The high flow rate was selected for testing to provide information on a worst-case scenario where a stagnation period that promotes anoxic/reducing conditions to establish in the CWTS is followed by a high flow event which rapidly provides oxygenated water to the system. The stability of treated COPI was therefore evaluated through this transition as fresh water flowed through the CWTS (Initial Flush). Subsequent treatment of each COPI was also evaluated through two high flow rate testing events (Post-stagnation 1 and 2) for comparison to treatment during the high flow rate test periods prior to stagnation (Pre-stagnation).

Stagnation had minimal effect on stability and treatment of cadmium, copper, and lead (Figure 8-23, Figure 8-24, and Figure 8-25, respectively). Both CWTS designs showed treatment of cadmium, copper, and lead through the initial flush after the stagnation period, with no leaching or increased concentrations of COPIs compared to the influent concentration during the initial flush post stagnation. Treatment of all COPIs was similar to pre-stagnation test events at the high flow 1.5 day HRT within one to two HRT periods. While there were instances where the outflow concentration was greater than the receiving environment WQO for cadmium and copper, results were consistent with

treatment observed pre-stagnation (Section 8.4.1.1) indicating rapid recovery of the CWTS. Furthermore, as noted above the stagnation trials are intended to provide information on a worst-case scenario with a high flow rate and short retention time through the system, whereas a gradual increase of flows to the CWTS would be a more likely scenario following a stagnation event due to a drought. The water sedge system consistently achieved outflow concentrations below the receiving environment WQOs for these COPIs in the very low, low, and medium flow rate test periods (Section 8.4.1.1).

Figure 8-23: Dissolved Cadmium Treatment Post Stagnation Testing in Both Constructed Wetland Treatment System Designs

Treatment cell in CWTS identified by shape: A Cell (triangle), B Cell (square), C Cell (circle). Pre stagnation data are an average of all operational stage 2 high flow sampling events, with error bars indicating the lowest and highest concentrations in each cell. The detection limit for dissolved cadmium was 0.0000050 mg/L. The lower limit of the receiving environment WQO is indicated with a dotted line (0.000377 – 0.000456 mg/L).

Figure 8-24: Dissolved Copper Treatment Post Stagnation Testing in Both Constructed Wetland Treatment System Designs

Treatment cell in CWTS identified by shape: A Cell (triangle), B Cell (square), C Cell (circle). Pre stagnation data are an average of all operational stage 2 high flow sampling events, with error bars indicating the lowest and highest concentrations in each cell. The detection limit for dissolved copper was 0.000050 mg/L. The receiving environment WQO is indicated with a dotted line (0.00144 mg/L).

Figure 8-25: Total Lead Treatment Post Stagnation Testing in Both Constructed Wetland Treatment System Designs

Treatment cell in CWTS identified by shape: A Cell (triangle), B Cell (square), C Cell (circle). Pre stagnation data are an average of all operational stage 2 high flow sampling events, with error bars indicating the lowest and highest concentrations in each cell. The detection limit for total lead was 0.000020 mg/L. The lower limit of the receiving environment WQO is indicated with a dotted line (0.012 – 0.017 mg/L).

8.4.2 ARSENIC, ANTIMONY, AND ZINC

8.4.2.1 Treatment Evaluation

The average concentration of total arsenic, total antimony, and dissolved zinc entering the CWTS remained stable throughout pilot-scale testing (average of 0.06 mg/L, 0.02 mg/L, and 0.16 mg/L, respectively; Table 4-2; Appendix A, Table A4-1) and were consistent with the “worst case” concentrations based on the 2018 water quality model.

The water sedge CWTS exhibited higher percent removal (47% to 89%) of total arsenic in all flow periods compared to the bulrush CWTS (12% to 62%; Table 8-8). A similar trend was observed for dissolved zinc, where the water sedge

CWTS had a higher percent removal (65% to 98%) compared to the bulrush (7% to 81%; Table 8-9). The variability in percent removal is attributed to the flow periods that were tested, with lower percent removal (albeit higher load removed per day) at the high flow period with a 1.5 day HRT. Total arsenic was treated to concentrations below the receiving environment WQO in all flow periods with the exception of medium and high flow testing periods in the bulrush design (5- and 1.5-day HRT; Table 8-8 and Figure 8-26).

Table 8-8: Total Arsenic Treatment Summary Through Pilot-scale Constructed Wetland Treatment System Testing Periods

Summary (Average)	Bulrush				Water Sedge			
	Very Low	Low	Medium	High	Very Low	Low	Medium	High
Influent (mg/L) ¹	0.0601	0.0614	0.0611	0.0623	0.0601	0.0614	0.0611	0.0623
Outflow (mg/L) ¹	0.0289	0.0218	0.0374	0.0542	0.0065	0.0070	0.0114	0.0319
% Removal ²	52%	62%	37%	12%	89%	87%	79%	47%
Load Removed (mg/day) ³	0.55	1.14	2.33	2.55	0.62	1.02	2.69	5.42

Period identified by flow where: Very low flow: 25-day HRT; low flow: 16-day HRT; medium flow: 5-day HRT; high flow: 1.5-day HRT.

Green shading indicates concentrations were at or below the receiving environment WQO (0.037 mg/L). The detection limit was 0.000020 mg/L.

¹ Averages calculated using results from all sampling events at a given flow period (e.g. 5-day HRT for medium flow testing is average of 6 sampling events). Raw data can be found in Appendix A, Table A4-1.

² % removal calculated for each sampling event based on influent and outflow concentrations and then averaged for each flow testing period. % removal has not been corrected for water loss through evapotranspiration.

³ Load removed calculated for each sampling event based on influent and outflow concentrations and volume of water through the system and then averaged for each flow testing period.

Table 8-9: Dissolved Zinc Treatment Summary Through Pilot-scale Constructed Wetland Treatment System Testing Periods

Summary (Average)	Bulrush				Water Sedge			
	Very Low	Low	Medium	High	Very Low	Low	Medium	High

Outflow (mg/L) ¹	0.0530	0.0260	0.0642	0.1511	0.0033	0.0033	0.0087	0.0568
% Removal ²	67%	81%	61%	7%	98%	97%	94%	65%
Load Removed (mg/day) ³	2.03	4.09	9.56	3.30	1.88	3.08	8.48	18.83

Period identified by flow where: Very low flow: 25-day HRT; low flow: 16-day HRT; medium flow: 5-day HRT; high flow: 1.5-day HRT.

Green shading indicates concentrations were at or below the lower limit of the receiving environment WQO (0.039-0.073 mg/L). The detection limit was 0.00010 mg/L.

¹ Averages calculated using results from all sampling events at a given flow period (e.g. 5-day HRT for medium flow testing is average of 6 sampling events). Raw data can be found in Appendix A, Table A4-1.

² % removal calculated for each sampling event based on influent and outflow concentrations and then averaged for each flow testing period. % removal has not been corrected for water loss through evapotranspiration.

³ Load removed calculated for each sampling event based on influent and outflow concentrations and volume of water through the system and then averaged for each flow testing period.

Figure 8-26: Average Total Arsenic Concentrations for Both Constructed Wetland Treatment System Designs During Each Flow Period

Replicate CWTS designs are grouped and averaged. Treatment period identified by targeted flow and HRT. Treatment cell in CWTS identified by shape: A Cell (triangle), B Cell (square), C Cell (circle). The error bars indicate the lowest and highest concentrations in each cell for each flow period. The detection limit for total arsenic was 0.000020 mg/L. The receiving environment WQO is indicated with a dotted line (0.037 mg/L).

Dissolved zinc was treated to concentrations below the lower receiving environment WQO of 0.039 mg/L in all flow periods in the water sedge design except the high flow period, where concentrations were below the upper WQO of 0.073 mg/L (Table 8-9 and Figure 8-27). Only the low flow period for the bulrush design met the lower receiving environment WQO in 15 of the 18 sampling events, while the medium flow and very low flow periods were below the upper WQO (Table 8-9 and Figure 8-27).

Figure 8-27: Average Dissolved Zinc Concentrations for Both Constructed Wetland Treatment System Designs During Each Flow Period

Replicate CWTS designs are grouped and averaged. Treatment period identified by targeted flow and HRT. Treatment cell in CWTS identified by shape: A Cell (triangle), B Cell (square), C Cell (circle). The error bars indicate the lowest and highest concentrations in each cell for each flow period. The detection limit for total zinc was 0.00010 mg/L. The lower receiving environment WQO for the CWTS is indicated with a dotted line (0.039 - 0.073 mg/L).

Total antimony also exhibited a higher percent removal in the water sedge CWTS (12% to 86%) compared to the bulrush CWTS (2% to 48%) (Table 8-10). The water sedge design achieved outflow total antimony concentrations equal to or below the receiving environment WQO (0.009 mg/L) during the medium flow (5-day HRT), low flow (16-day HRT)

and very low flow periods (25-day HRT; Table 8-10 and Figure 8-28). The bulrush CWTS design did not achieve total antimony concentrations below the WQO during any flow period (Table 8-10 and Figure 8-28).

Similar to other COPI, the water sedge design demonstrated faster treatment of arsenic, zinc, and antimony compared to the bulrush design (Table 8-2). The RRCs for arsenic and zinc in the water sedge CWTS were improved compared to the proxy RRCs that were developed based on other Projects with similar chemistry and conditions to the Project site that have been used (Section 3.2 and 8.3), whereas the bulrush exhibited lower RRC for zinc and similar RRC for arsenic compared to the proxy RRCs.

Table 8-10: Total Antimony Treatment Summary Through Pilot-scale Constructed Wetland Treatment System Testing Periods

The receiving environment WQO is indicated with a dotted line (0.009 mg/L).

8.4.2.2 Fate, Distribution, and Stability

The fate and distribution of arsenic, antimony, and zinc removed from the water during the pilot-scale testing (including commissioning) were evaluated for each CWTS design. The concentration of each COPI was measured at the end of the pilot-scale trials in the top ~5 cm of substrate, the above water plant tissues, and the organic material in the water column of the cell (e.g. moss, straw, and duckweed) as described in Section 7.3 and 8.4.1.2. The distribution of the COPI in the pilot CWTS was then evaluated, with load retained in 'other' locations within the CWTS cells which were not measured including substrate deeper than 5 cm, plant roots, biofilms on the walls of the CWTS cells, and forebay straw (where applicable).

Of the load of arsenic that entered the series through the pilot-scale test work, 0.338 to 0.484 g of arsenic was retained (Table 8-11), which corresponds to 36% to 50% and 72% to 84% of the load that entered the CWTS retained in the bulrush and water sedge CWTS, respectively. For antimony, 0.065 to 0.124 g was retained (Table 8-11), which corresponds to 20% to 28% and 57% to 81% of the load that entered the CWTS retained in each of the bulrush and water sedge CWTS, respectively. For zinc, 1.13 to 1.47 g was retained (Table 8-11), which corresponds 49% to 62% and 82% to 94% of the load that entered the CWTS retained in each of the bulrush and water sedge CWTS, respectively.

Of the load that entered each series, the distribution of that load into the top ~5 cm of substrate, the above water plant tissues, and the organic material in the water column of the cell was evaluated. Arsenic and zinc concentrations in the top 5 cm of substrate at the end of the pilot-scale trials were within method accuracy of the respective starting concentrations (Appendix A, Table A6-1). The change in antimony concentration in the top 5 cm of substrate represented 6.9% to 22% of the retained antimony load in the bulrush CWTS, and 5.9% to 8.1% in the water sedge CWTS.

There was minimal uptake of arsenic and antimony by bulrush (less than 1% of load retained; Table 8-11) and zinc into bulrush (less than 1%). Uptake of arsenic and antimony by water sedge was also minimal (less than 1% of load retained; Table 8-11) while uptake of zinc was slightly higher (less than 3.1%). The concentrations of zinc in the pilot-scale CWTS water sedge were within or slightly above ranges observed previously on site (18.4 to 93.4 mg/kg in the pilots

[Appendix A, Table A5-3] compared to 9.82 to 78.2 mg/kg measured in plants collected during the 2015 site assessment (Contango, 2016).

In the water sedge CWTS design, organics in the water column accounted for 1.5% to 18% of the retained arsenic, antimony, and zinc (Table 8-11). In the bulrush CWTS design, organics in the water column accounted for 15% to 60% of the retained arsenic and zinc, and 5.6% to 18% of the retained antimony. There was more arsenic and zinc retention in the organics in the bulrush systems compared to the water sedge systems, while relatively similar antimony retention was observed in the organics in both designs. The rest of the retained arsenic, antimony, and zinc was held in the 'other' category of the CWTS described above for both designs (40% to 92% and 80% to 95% for bulrush and water sedge, respectively; Table 8-11).

Table 8-11: Load of Arsenic, Antimony, and Zinc Retained and Percent Distribution Within the CWTS

Series	Load Retained (g)	Load Retained (%) ¹	Percent of Load Retained (%) ²			
			Top 5 cm substrate ³	Above Water Plant Tissue ⁴	Organics in Water Column ⁵	Deep Substrate/Root Zone & Other ⁶
Arsenic

Water Sedge 4	1.47	82	NM	3.1	3.5	93
Water Sedge 5	1.13	94	NM	2.1	9.8	88
Water Sedge 6	1.47	90	NM	1.7	18	80

NM: Not measurable (final concentrations of COPs were within method error of initial concentrations. Method error was 20% for initial and 30% for final samples).

¹ Calculated by dividing the load retained (g) by the load in (g) over the entire pilot trial. Load in varies based on the retention time of each series.

² Calculated by dividing the load retained in respective area of the CWTS by the overall load retained for each series.

³ Top 5 cm of substrate collected from each CWTS cell.

⁴ All above water plant tissue collected from each CWTS cell.

⁵ Organic material including moss, straw, and duckweed collected from each CWTS cell.

⁶ Percent retained in the 'other' category is the remaining load retained that was not accounted for by the top 5 cm substrate, above water plant tissue, and organic material in water column. This includes deeper substrate, plant roots, biofilms on the walls of the CWTS cells, and forebay straw (where applicable).

Tessier extraction indicated that approximately 75% to 95% of the substrate arsenic burden was found in the residual Fraction 5 pool (Figure 8-29; Appendix A, Table A6-2). Fractions 3 and 4, representing the iron/manganese oxide-bound and sulphide/organics bound pools, respectively, comprised the next most abundant arsenic pools. That the majority was present in the residual mineral fraction indicates that most arsenic in the substrate is not mobile given the strong acids required to liberate Fraction 5. Compared with the initial substrate sample, some redistribution of arsenic was observed from Fraction 3 (iron/manganese oxides) towards Fraction 4 (sulphide- and/or organic-bound) by the end of pilot-scale testing (Figure 8-29). This is suggestive of re-precipitation of arsenic as a sulphide or co-precipitation with iron sulphide, which is expected to provide long term stability under the reducing conditions of the CWTS. There was

no notable difference in arsenic forms in the substrate between the bulrush and water sedge systems, except for cell 4A (water sedge) that exhibited a higher proportion of arsenic in Fraction 4.

Figure 8-29: Fraction Distribution of Arsenic in the CWTS Pilot Design Expressed as a % of the sum From Tessier Extractions (Top) and as mg/kg (Bottom)

Results of Tessier sequential extraction determining mineral forms of arsenic in the top 5 cm of substrate. Whited out areas are values at or below detection limits.

For antimony the initial substrate was predominantly below detection limits in the sequential Tessier extraction (Figure 8-30). However, lower detection limits were achieved for the testing performed at the end of the pilot-scale trials), which indicated the bulk of the antimony was associated with Fraction 5, which is recalcitrant to mobilization under field environmental conditions.

Zinc was primarily hosted in Fraction 5 for most CWTS cells including the initial substrate sample (Figure 8-31). Fraction 1, which represents the exchangeable fraction (i.e., labile), comprised the bulk of zinc in the bulrush cell 3A and a significant proportion of substrate zinc in water sedge cells 5C and 6A. Although zinc was loaded into the CWTS in concentrations that were too low to evaluate any notable changes in substrate composition from initial sampling, cell 4A (water sedge) exhibited a marked increase in the proportion of zinc in Fraction 4, consistent with the enhanced zinc removal observed for the water sedge systems. Zinc is not expected to be mobile given the majority is hosted in the recalcitrant residual Fraction 5. The elevated proportion of zinc associated with the exchangeable Fraction 1 in cells 3A, 5C, and 6A is more prone to mobilization, but the high ionic strength of the extraction used for Fraction 1 (1 M magnesium chloride) likely overestimates the fraction of zinc that may be labile. Furthermore, zinc released via desorption under reducing conditions will likely be re-sequestered as a sulphide phase under the sulphate-reducing conditions present within the CWTS.

Figure 8-30: Fraction Distribution of Antimony in the CWTS Pilot Design Expressed as a % of the sum From Tessier Extractions (Top) and as mg/kg (Bottom)

Results of Tessier sequential extraction determining mineral forms of antimony in the top 5 cm of substrate. Whited out areas are values at or below detection limits.

Figure 8-31: Fraction Distribution of Zinc in the CWTS Pilot Design Expressed as a % of the sum From Tessier Extractions (Top) and as mg/kg (Bottom)

Results of Tessier sequential extraction determining mineral forms of zinc in the top 5 cm of substrate. Whited out areas are values at or below detection limits.

8.4.2.3 Freeze-thaw Testing

The arsenic that was retained in the CWTS remained predominantly stable through a freeze-thaw process. An estimate of 95% and 94% of the load of arsenic held within the CWTS through the pilot-scale trials was retained through the freezing and thawing of the bulrush and water sedge CWTS designs, respectively (Table 8-12). Zinc also exhibited stability with approximately 93% and 97% of zinc retained through the freeze-thaw trials in the water sedge and bulrush, respectively (Table 8-12). No release of stored antimony was exhibited through the freeze-thaw trials (Table 8-12). As noted in Section 6.9 and discussed in Section 8.4.1.3, the freeze-thaw testing is intended to evaluate stability and potential for COPI release through a freeze-thaw cycle and does not demonstrate subsequent water treatment as it flows through the CWTS.

Table 8-12: Load of Arsenic, Antimony, and Lead Released and Percent Retained Through Freeze-Thaw Testing.

COPI	Pilot-scale CWTS	Load retained (g)	Load released through freeze-thaw (g)	Percent retained
Arsenic	Bulrush (series 3)	0.370	0.020	95%
	Water sedge (series 6)	0.436	0.027	94%
Antimony	Bulrush (series 3)	0.082	0	> 99%
	Water sedge (series 6)	0.116	0	> 99%
Zinc	Bulrush (series 3)	1.423	0.099	93%
	Water sedge (series 6)	1.468	0.043	97%

8.4.2.4 Stagnation Testing

The bulrush CWTS designs showed decreased concentrations of arsenic and antimony through the stagnation and initial flush of water through the system, with subsequent treatment observed to be similar to the pre-stagnation test events at the high flow 1.5-day HRT (Figure 8-32 and Figure 8-33). In contrast, the water sedge CWTS showed an increase in concentrations of arsenic and antimony through the stagnation and initial flush in the A cell of the series, which was then treated as it flowed through the system (Figure 8-32, Figure 8-33). Treatment of arsenic and antimony in the water sedge CWTS recovered rapidly and was similar to the pre-stagnation test events at the high flow 1.5-day HRT.

Both CWTS designs showed continued treatment of zinc through the stagnation period, with no leaching or increased concentrations of the COPI compared to the influent concentration (Figure 8-34). The bulrush CWTS demonstrated temporarily improved treatment through the stagnation and subsequent initial flush (Figure 8-34).

As discussed in Section 8.4.1.4, the stagnation trials are intended to provide information on a worst-case scenario where a stagnation period that promotes anoxic/reducing conditions to establish in the CWTS is followed by a high flow event which rapidly provides oxygenated water to the system. While there were instances where the outflow concentration was greater than the receiving environment WQO for COPIs, water sedge treatment results were consistent with treatment observed pre-stagnation (Section 8.4.2.1) indicating rapid recovery of the CWTS.

Figure 8-32: Total Arsenic Treatment Post Stagnation Testing in Both Constructed Wetland Treatment System Designs

Treatment cell in CWTS identified by shape: A Cell (triangle), B Cell (square), C Cell (circle). Pre stagnation data are an average of all operational stage 2 high flow sampling events, with error bars indicating the lowest and highest concentrations in each cell. The detection limit for total arsenic was 0.000020 mg/L. The receiving environment WQO is indicated with a dotted line (0.037 mg/L).

Figure 8-33: Total Antimony Treatment Post Stagnation Testing in Both Constructed Wetland Treatment System Designs

Treatment cell in CWTS identified by shape: A Cell (triangle), B Cell (square), C Cell (circle). Pre stagnation data are an average of all operational stage 2 high flow sampling events, with error bars indicating the lowest and highest concentrations in each cell. The detection limit for total antimony was 0.000020 mg/L. The receiving environment WQO is indicated with a dotted line (0.009 mg/L).

Figure 8-34: Dissolved Zinc Treatment Post Stagnation Testing in Both Constructed Wetland Treatment System Designs

Treatment cell in CWTS identified by shape: A Cell (triangle), B Cell (square), C Cell (circle). Pre stagnation data are an average of all operational stage 2 high flow sampling events, with error bars indicating the lowest and highest concentrations in each cell. The detection limit for total zinc was 0.00010 mg/L. The lower receiving environment WQO is indicated with a dotted line (0.039 - 0.073 mg/L).

8.4.3 SELENIUM AND URANIUM

8.4.3.1 Treatment Evaluation

Selenium and uranium are COPIs which can be directly reduced by microbes into insoluble forms under reducing conditions (Section 3.6.2 and 3.6.3). They are therefore discussed together in this section.

The average total concentrations of selenium and uranium entering the CWTS remained stable throughout the pilot-scale testing (0.008 mg/L and 0.029 mg/L, respectively; Table 4-2; Appendix A, Table A4-1). Dissolved and total concentrations for both COPIs were similar throughout CWTS testing. The targeted COPI concentrations were consistent with the 2018 "worst case" WQM predicted concentrations (Table 4-2). The water sedge design had faster treatment with higher RRC for selenium and uranium compared to the bulrush design (Table 8-2).

The water sedge CWTS exhibited higher percent removal (34% to 95%) of total selenium in all flow periods compared to the bulrush (4% to 63%) (Table 8-13). In the water sedge CWTS, selenium was treated below the lower receiving environment WQO (0.00243 to 0.00316 mg/L) in all flow periods except high flow (1.5-day HRT), which was close to the upper WQO, and two medium flow sampling events (Table 8-13, Figure 8-35). In the bulrush CWTS, selenium was treated below the upper WQO (0.00316 mg/L) only in the very low flow and low flow periods (25-day to 15-day HRT) (Table 8-13; Figure 8-35).

Table 8-13: Total Selenium Treatment Summary Through Pilot-scale Constructed Wetland Treatment System Testing Periods

Summary (Average)	Bulrush				Water Sedge			
	Very Low	Low	Medium	High	Very Low	Low	Medium	High
Influent (mg/L) ¹	0.00750	0.00745	0.00767	0.00764	0.00750	0.00745	0.00767	0.00764
Outflow (mg/L) ₁	0.00315	0.00288	0.00618	0.00732	0.00042	0.00037	0.00160	0.00491
% Removal ²	58%	63%	19%	4%	94%	95%	77%	34%
Load Removed (mg/day) ³	0.08	0.13	0.14	0.09	0.08	0.13	0.33	0.48

Period identified by flow where: Very low flow: 25-day HRT; low flow: 16-day HRT; medium flow: 5-day HRT; high flow: 1.5-day HRT.

Green shading indicates concentrations were below the lower limit of the receiving environment WQO (0.00243 – 0.00316 mg/L). The detection limit was 0.000040 mg/L.

¹ Averages calculated using results from all sampling events at a given flow period (e.g. 5-day HRT for medium flow testing is average of 6 sampling events). Raw data can be found in Appendix A, Table A4-1.

² % removal calculated for each sampling event based on influent and outflow concentrations and then averaged for each flow testing period. % removal has not been corrected for water loss through evapotranspiration.

³ Load removed calculated for each sampling event based on influent and outflow concentrations and volume of water through the system and then averaged for each flow testing period.

Figure 8-35: Average Total Selenium Concentrations for Both Constructed Wetland Treatment System Designs During Each Flow Period

Replicate CWTS designs are grouped and averaged. Treatment period identified by targeted flow and HRT. Treatment cell in CWTS identified by shape: A Cell (triangle), B Cell (square), C Cell (circle). The error bars indicate the lowest and highest concentrations in each cell for each flow period. The detection limit for total selenium was 0.000040 mg/L. The lower receiving environment WQO is indicated with a dotted line (0.00243 – 0.00316 mg/L).

The percent removal of total uranium was also higher in the water sedge CWTS compared to the bulrush CWTS, with percent removals ranging from 45% to 84% and 9% to 40%, respectively (Table 8-14). While total uranium was treated to concentrations below the receiving environment WQO (0.015 mg/L) during all flow periods in the water sedge CWTS design, the WQO were not met in the bulrush CWTS design in any flow period (Table 8-14; Figure 8-36).

Table 8-14: Total Uranium Treatment Summary Through Pilot-scale Constructed Wetland Treatment System Testing Periods

Summary (Average)	Bulrush				Water Sedge			
	Very Low	Low	Medium	High	Very Low	Low	Medium	High
Influent (mg/L) ¹	0.0284	0.0297	0.0292	0.0290	0.0284	0.0297	0.0292	0.0290
Outflow (mg/L) ¹	0.0258	0.0157	0.0184	0.0217	0.0065	0.0034	0.0052	0.0147
% Removal ²	9%	40%	34%	23%	77%	84%	80%	45%
Load Removed (mg/day) ³	0.05	0.41	1.01	2.33	0.25	0.49	1.29	2.53

Period identified by flow where: Very low flow: 25-day HRT; low flow: 16-day HRT; medium flow: 5-day HRT; high flow: 1.5-day HRT.

Green shading indicates concentrations were below the receiving environment WQO (0.015 mg/L). The detection limit was 0.000050 mg/L.

¹ Averages calculated using results from all sampling events at a given flow period (e.g. 5-day HRT for medium flow testing is average of 6 sampling events). Raw data can be found in Appendix A, Table A4-1.

² % removal calculated for each sampling event based on influent and outflow concentrations and then averaged for each flow testing period. % removal has not been corrected for water loss through evapotranspiration.

³ Load removed calculated for each sampling event based on influent and outflow concentrations and volume of water through the system and then averaged for each flow testing period.

Figure 8-36: Average Total Uranium Concentrations for Both Constructed Wetland Treatment System Designs During Each Flow Period

Replicate CWTS designs are grouped and averaged. Treatment period identified by targeted flow and HRT. Treatment cell in CWTS identified by shape: A Cell (triangle), B Cell (square), C Cell (circle). The error bars indicate the lowest and highest concentrations in each cell for each flow period. The detection limit for total uranium was 0.000040 mg/L. The receiving environment WQO for the CWTS is indicated with a dotted line (0.015 mg/L).

8.4.3.2 Fate, Distribution, and Stability

The fate and distribution of selenium and uranium removed from the water during the pilot-scale testing were evaluated for each CWTS design. Distribution between the top 5 cm of substrate, the above water plant tissues, and the organic material in the water column of the cell (e.g. moss, straw, and duckweed) was evaluated as described in Section 7.3 and 8.4.1.2. The distribution of the COPI in the pilot CWTS was then evaluated, with load retained in 'other' locations within the CWTS cells which were not measured including substrate deeper than 5 cm, plant roots, biofilms on the walls of the CWTS cells, and forebay straw (where applicable).

The bulrush series retained 0.030 to 0.038 g of selenium, and the water sedge series retained 0.059 to 0.056 g (Table 8-15). Overall, 23% to 37% of total selenium entering the bulrush CWTS and 68% to 89% entering the water sedge design was retained in the system. There was minimal uptake into both above water plant types as targeted, with less than 1% retained by bulrush tissue and less than 1.1% retained by water sedge tissue (Table 8-15; Appendix A, Table A5-3). The concentrations of selenium in the top 5 cm of substrate at the end of the pilot-scale trials were all below the detection limit (Appendix A, Table A6-1). The organics in the water column accounted for 12% to 37% and 1.6% to 13% of retained selenium in the bulrush and water sedge series, respectively. A comparison across CWTS designs reveals more selenium retention in the organics in the bulrush design compared to water sedge design, likely due to more moss in the bulrush CWTS. The rest of the retained selenium was held in the deep substrate/root zone and 'other' locations of the CWTS as described above (bulrush: 63% to 88%; water sedge: 86% to 97%).

The bulrush series retained 0.127 to 0.183 g of uranium, and the water sedge series retained 0.179 to 0.204 g through the pilot-scale test work (Table 8-15). Of the load of uranium entering the CWTS, 26% to 44% and 67% to 91% was retained in the bulrush and water sedge systems, respectively. There was minimal uptake by both above water plant types as targeted, with less than 1% retained by bulrush tissue and less than 1% retained by water sedge tissue (Table 8-15; Appendix A, Table A5-3). Uranium concentrations in the top 5 cm of substrate at the end of the pilot-scale trials were within method accuracy (30%) of the respective starting concentrations (Appendix A, Table A6-1). The organics in the water column accounted for 22% to 53% and 1.2% to 13% of retained uranium in the bulrush and water sedge

series, respectively. The rest of the retained uranium was held in the 'other' category of the CWTS as described above (bulrush: 47% to 78%; water sedge: 86% to 98%).

Table 8-15: Load of Selenium and Uranium Retained and Percent Distribution Within the CWTS

Series	Load Retained (g)	Load Retained (%) ¹	Percent of Load Retained (%) ²			
			Top 5 cm substrate ³	Above Water Plant Tissue ⁴	Organics in Water Column ⁵	Deep Substrate/Root Zone & Other ⁶
Selenium						
Bulrush 1	0.030	23	NM	0.2	37	63
Bulrush 2	0.031	37	NM	0.2	18	82
Bulrush 3	0.038	33	NM	0.4	12	88
Water Sedge 4	0.056	68	NM	1.1	1.6	97
Water Sedge 5	0.049	89	NM	0.9	5.9	93
Water Sedge 6	0.054	72	NM	0.9	13	86
Uranium						
Bulrush 1	0.127	26	NM	0.0	53	47
Bulrush 2	0.137	44	NM	0.0	29	71
Bulrush 3	0.183	43	NM	0.1	22	78
Water Sedge 4	0.204	67	NM	0.5	1.2	98
Water Sedge 5	0.179	91	NM	0.2	5.1	95
Water Sedge 6	0.203	73	NM	0.4	13.1	86

NM: Not measurable (final concentrations of COPs were within method error of initial concentrations. Method error was 20% for initial and 30% for final samples).

¹ Calculated by dividing the load retained (g) by the load in (g) over the entire pilot trial. Load in is varied based on the retention time of each series.

² Calculated by dividing the load retained in respective area (of the CWTS by the overall load retained for each series).

³ Top 5 cm of substrate collected from each CWTS cell.

⁴ All above water plant tissue collected from each CWTS cell.

⁵ Organic material including moss, straw, and duckweed collected from each CWTS cell.

⁶ Percent retained in the 'other' category is the remaining load retained that was not accounted for in the top 5 cm substrate, above water plant tissue, and organic material in water column. This includes deeper substrate, plant roots, biofilms on the walls of the CWTS cells, and forebay straw (where applicable).

Selenium was present in the CWTS in concentrations that were too low to evaluate any notable changes in the substrate (Figure 8-37). The starting substrate was predominantly below detection limits for the sequential Tessier extraction analysis. Improved detection limits available for the testing performed at the end of the pilot-scale trials identified selenium concentrations above detection in Fraction 4 only (Appendix A, Table A6-2). Selenium is expected to be removed as elemental selenium under the reducing conditions within the CWTS. This is consistent with the detection of selenium in Fraction 4, since this step uses an oxidizing extraction solution (hydrogen peroxide) which would oxidize elemental selenium to soluble selenite and/or selenate. The detection limited results for the other Tessier fractions precludes further in-depth discussion; however, selenium is expected to be stable when sequestered as elemental selenium under the reducing conditions of the CWTS.

Figure 8-37: Fraction Distribution of Selenium in the CWTS Pilot Design Expressed as a % of the sum From Tessier Extractions (Top) and as mg/kg (Bottom)

Results of Tessier sequential extraction determining mineral forms of selenium in the top 5 cm of substrate. Whited out areas are values at or below detection limits.

Uranium was predominantly present in the substrate at the end of the pilot-scale trials bound to carbonates (Fraction 2) and the residual minerals form (Fraction 5) (Figure 8-38; Appendix A, Table A6-2). There was an increase in uranium in Fraction 2 in both systems compared to the initial sample, and slightly larger increases in Fraction 2 in the water sedge systems. Alkalinity is generated by the mineralization of organic carbon under reducing conditions, providing conditions for the formation of carbonate minerals in these anaerobic circumneutral pH experiments. Recent research suggests that the biogenic reduced uranium expected to have formed in the CWTS is associated with both organic carbon and carbonates (Bhattacharyya et al., 2017). That a greater fraction of uranium in the CWTS substrate was associated with Fraction 2 is consistent with the work of Bhattacharyya et al. (2017) and points toward the formation of reduced U(IV) phases in the CWTS substrate. Given that uranium is largely associated with the residual Fraction 5, the bulk of substrate uranium is not mobile. Furthermore, the lack of acidic influent expected for the CWTS suggests that uranium sequestered with carbonate minerals is also unlikely to be mobilized within the CWTS.

Figure 8-38: Fraction Distribution of Uranium in the CWTS Pilot Design Expressed as a % of the sum From Tessier Extractions (Top) and as mg/kg (Bottom)

Results of Tessier sequential extraction determining mineral forms of uranium in the top 5 cm of substrate. Whited out areas are values at or below detection limits.

8.4.3.3 Freeze-thaw Testing

The selenium and uranium that was retained in the CWTS remained stable through a freeze-thaw process (Table 8-16). No release of selenium, and no or minimal release of uranium was observed upon thawing; (99% of uranium load retained of in the water sedge, and no release in the bulrush).

Table 8-16: Load of Selenium and Uranium Released and Percent Retained Through Freeze-Thaw Testing

COPI	Pilot-scale CWTS	Load retained (g)	Load released through freeze-thaw (g)	Percent retained
Selenium	Bulrush (series 3)	0.038	0	> 99%
	Water sedge (series 6)	0.054	0	> 99%
Uranium	Bulrush (series 3)	0.183	0	> 99%
	Water sedge (series 6)	0.203	0.002	99%

8.4.3.4 Stagnation Testing

The bulrush CWTS designs showed decreased concentrations of selenium through the stagnation and initial flush of water through the system, with subsequent treatment observed to be similar to the pre-stagnation test events at the high flow 1.5 day HRT (Figure 8-39). The water sedge CWTS showed a slight increase in selenium concentrations through the stagnation and initial flush of water through the system, which was predominantly due to concentration of the COPI from water loss through trial. Subsequent treatment was similar to the pre-stagnation test events within two HRT periods (Figure 8-39).

Both CWTS designs showed increased concentrations of uranium through the stagnation and initial flush of water through the system (Figure 8-40). The water sedge CWTS design had an increase in uranium concentration in the A cell and subsequent uranium removal as water flowed through the system, while the bulrush CWTS had minimal treatment through the first flush. Treatment recovered rapidly in both CWTS designs and was similar to pre-stagnation test events at the high flow 1.5 day HRT.

As discussed in Section 8.4.1.4, the stagnation trials are intended to provide information on a worst-case scenario where a stagnation period that promotes anoxic/reducing conditions to establish in the CWTS is followed by a high flow event which rapidly provides oxygenated water to the system. While the selenium outflow concentrations were greater than the receiving environment WQO, treatment results were consistent with treatment observed pre-stagnation (Section 8.4.1.4) indicating rapid recovery of the CWTS. Furthermore, a gradual increase of flows to the CWTS would be a more likely scenario following a stagnation event due to a drought. The water sedge system achieved selenium outflow concentrations below the receiving environment WQOs in the very low, low, and medium flow rate test periods (Section 8.4.1.4).

Figure 8-39: Total Selenium Treatment Post Stagnation Testing in Both Constructed Wetland Treatment System Designs

Treatment cell in CWTS identified by shape: A Cell (triangle), B Cell (square), C Cell (circle). Pre stagnation data are an average of all high flow forebay sampling events, with error bars indicating the lowest and highest concentrations in each cell. The detection limit for total selenium was 0.000040 mg/L. The lower receiving environment WQO is indicated with a dotted line (0.00243 – 0.00316 mg/L).

Figure 8-40: Total Uranium Treatment Post Stagnation Testing in Both Constructed Wetland Treatment System Designs

Treatment cell in CWTS identified by shape: A Cell (triangle), B Cell (square), C Cell (circle). Pre stagnation data are an average of all high flow forebay sampling events, with error bars indicating the lowest and highest concentrations in each cell. The detection limit for total uranium was 0.000040 mg/L. The receiving environment WQO is indicated with a dotted line (0.015 mg/L).

8.5 ACID VOLATILE SULPHIDES

The mechanism of producing sulphide in a CWTS is biological and therefore, production rates of sulphide could be affected by temperature. Likewise, purely biological reactions may have difficulty in directly accommodating large spikes of COPI concentrations. Fortunately, when excess sulphides are generated by SPB and there is also excess iron present, sulphides can be stored in the substrate as AVS for future use in COPI treatment in an on-demand manner. AVS

are biogenically formed amorphous iron sulphides. The amorphous structure and solubility constant of the AVS results in the sulphide preferentially exchanging iron for COPI with a greater affinity for the sulphide (e.g., antimony, cadmium, copper, lead, nickel, thallium, and zinc) which are then stably bound.

This beneficial treatment capacity through reserve of AVS can be tested for by a method that assays both the AVS and simultaneously extracted metals (SEM); cadmium, copper, lead, mercury, nickel, and zinc. If a substrate has a molar ratio of $\Sigma\text{SEM}:\text{AVS}$ less than one, then it is considered to be theoretically capable of exchanging iron for a SEM type COPI, enabling the CWTS to overcome influences of temperature and biological reaction rates on treatment of the COPI being removed as sulphide minerals. Moreover, when $\Sigma\text{SEM}:\text{AVS}$ is less than one the AVS can serve as a buffer to oxidation should the substrate of a reducing (sulphide-producing) CWTS be exposed to oxygen (e.g., briefly drying out), thereby making sequestered metals less likely to re-solubilize.

The water sedge systems had much greater AVS formation (0.62 to 9.16 $\mu\text{mol/g}$) than the bulrush systems (0.2 to 5.06 $\mu\text{mol/g}$) throughout pilot-scale testing (Figure 8-41, Appendix A, Table A6-3). Increases in AVS concentrations from the initial substrate were more notable in the C cells than the A cells (B cells were not analyzed) in both designs, which decreased following freeze-thaw, possibly due to AVS being utilized by the release of SEM type COPI during freeze-thaw testing. This is consistent with the COPI concentrations post-freeze testing, where minimal or no release of COPI from the substrate in the C cells of each series was observed. Water sedge had a molar ratio of $\Sigma\text{SEM}:\text{AVS}$ less than one in the substrate during pre- and post-freeze testing, indicating an excess of AVS in the substrate (Figure 8-42). Similarly, bulrush had a molar ratio of $\Sigma\text{SEM}:\text{AVS}$ less than one during all testing scenarios, with the exception of the A cells during pre-freeze and post-freeze testing. Overall, this suggests that the water sedge designs may have higher stabilisation and buffering capacity for metals treatment than the bulrush.

Figure 8-41: AVS Concentrations in the Bulrush and Water Sedge CWTS at Various Testing Stages

Pre-freeze/stag: samples collected immediately prior to the freeze-thaw and stagnation testing (series 1/3 and 4/6); Post-stag: samples collected after three high flow HRTs (series 1 and 4); V Low Flow: samples collected following very low flow testing (series 2 and 5); Post-freeze: samples collected after cell thawing (series 3 and 6).

Figure 8-42: Ratio of the Sum of SEM to AVS in A and C Cells of the Bulrush and Water Sedge CWTS at Various Testing Stages

Ratio of the sum of simultaneously extracted metals (SEM) and acid volatile sulphides (AVS). A SEM:AVS ratio <1 is targeted.

Pre-freeze/stag: samples collected immediately prior to the freeze-thaw and stagnation testing (series 1/3 and 4/6); Post-stag: samples collected after three high flow HRTs (series 1 and 4); V Low Flow: samples collected following very low flow testing (series 2 and 5); Post-freeze: samples collected after cell thawing (series 3 and 6).

8.6 MICROBIOLOGY

Specific types of bacteria have been evaluated in the substrate, moss, and roots in the CWTS to inform treatment mechanisms that are occurring. Background information on the targeted treatment mechanisms and bacteria involved in these biogeochemical reactions is provided in Section 3.6. DNA testing can be used to quantify and identify all bacteria in a sample, along with their relative abundance as a percentage of the community (Section 6.8). This reveals whether the desired types of bacteria are present in the community, and if there is biodiversity for the community to adapt to environmental change while maintaining the desired treatment pathways. In other words, diversity in beneficial microbes is favourable and can be regarded as a measure of robustness to conduct a given biogeochemical function, as multiple different bacteria will be able to carry out the beneficial reaction under a wider range of conditions than a small diversity of bacteria could. Key findings of microbial analyses for the CWTS are provided in the following sections.

8.6.1 SULPHIDE-PRODUCING BACTERIA

The substrate and roots in the pilot-scale CWTS had microbial communities that were more specialized for sulphide production than the moss, as evidenced by the higher percentage and diversity of sulphide-producing bacteria (SPBs) in the former two sample types (Figure 8-43 and Table 8-17). This was particularly evident in the bulrush CWTS. Percentages of SPBs in substrate samples were similar between the bulrush and water sedge CWTS, while the water sedge had higher percentages associated with the moss and root samples than the bulrush CWTS. The higher percentages associated with the water sedge CWTS reflects the more reducing conditions and consistently better treatment of COPI that can form insoluble sulphide minerals achieved in this design (Section 8.3). Higher quantities of SPBs were measured in the water sedge series at the midpoint of pilot-scale testing (August 14, 2019), which immediately followed the period with the most reducing conditions during the pilot tests (July to August 2019; Figure 8-2 and Figure 8-4). Quantities were generally lower at the end of the pilot trials, when conditions in the CWTS had

become gradually less reducing likely due to plant health as discussed further in Section 8.7. There was an increase in abundance and percentage of SPBs in the substrate after the stagnation period, as evidenced by the sample analyzed for cell 4A (Figure 8-43).

The plant roots were the source of most of the SPBs that developed in the CWTS. This indicates adaptation and growth of SPBs as intended with the reducing CWTS design, and confirms that the local water sedge plant from site would be a good candidate for full-scale CWTS design.

Figure 8-43: Sulphide-producing Bacteria Associated With Soil, Moss, and Root Samples From the Constructed Wetland Treatment System

The primary y-axis provides the percentage of the bacterial population (relative abundance) that corresponds to sulphide-producing bacteria through the reduction of sulphate, sulphite, thiosulphate, and sulphur. Organisms are classified to the genus or family level (f). The secondary y-axis provides the inferred abundance of SPBs in the substrate and moss samples (not applicable for root). Vertical lines are used to separate sample types. Samples are labelled according to the cell that the sample was collected, with midpoint samples (August 14) representing a composite of replicate series. End point samples (December) and post-stagnation samples (January 7 for cell 4A) are shown, along with Initial samples: M (moss), BR (bulrush root), SR (water sedge root), and S (substrate).

8.6.2 SELENIUM-REDUCING AND URANIUM-REDUCING BACTERIA

Selenium-reducing bacteria (SeRBs) were present in all sample types (i.e., moss, roots, substrate) tested in the pilot-scale CWTS. The water sedge CWTS generally had higher percentages of SeRBs than the bulrush CWTS (Appendix B), which is consistent with improved treatment observed in the water sedge CWTS compared to the bulrush CWTS (Section 8.4.3.1). There were differences in the types of SeRB associated with different sample types in the CWTS, which provided diversity in the SeRB population in the CWTS. Diversity was slightly lower in the moss samples than the root and substrate samples for both CWTS, and slightly higher in the water sedge CWTS overall (Table 8-17).

Table 8-17: Average Number of Different Types of Sulphide-producing Bacteria and Selenium-reducing Bacteria in the Constructed Wetland Treatment System Designs

Sample Type	Selenium-reducing Bacteria		Sulphide-producing Bacteria	
	Bulrush	Water	Bulrush	Water
Moss	12	18	7	16
Roots	17	21	19	22
Substrate	18	21	21	22

Average number of different types is based on the number of different bacteria that are identified as known selenium-reducing or sulphide-producing bacteria in each sample type.

Uranium-reducing bacteria (URB) were found in both CWTS designs, primarily associated with the substrate and root samples. The URB was associated with the initial plant roots from site, and are the likely source of these beneficial bacteria in the pilot-scale CWTS. There were similar percentages of URB in the substrate of both CWTS designs, while the water sedge design typically had higher percentages associated with root and moss than the bulrush design. This is consistent with the improved treatment of uranium observed in the water sedge CWTS design (Section 8.4.3.1). The microbiology results support the observation of microbially catalyzed uranium reduction in the pilot-scale CWTS (Section 8.4.3.2).

8.7 VEGETATION GROWTH AND HEALTH

Both water sedge and bulrush plant species established as intended through commissioning and into operations. In an on site CWTS a growing season for these plant species would be approximately 4-5 months (May-September), with natural die off occurring at the end of a growing season. The pilot-scale testing occurred over approximately 14 months (including initial plant growth and commissioning). Plant health in both of the plant species appeared to deteriorate towards the end of the pilot-scale trials (Photograph 8-4). This has not been observed previously in other off site pilot-scale trials, and may be due to the low levels of nutrients in the influent (and lack of replenishment of nutrients by annual plant die off). Likely due to plant health, conditions in the CWTS started to become less reducing towards the end of the pilot-scale trials. While this is not expected to occur on site as plants will follow their natural seasonal die off, it is recommended that this be evaluated during the on site demonstration-scale CWTS.

Straw was added to forebays in select series to evaluate the effect of additional organic carbon on system performance. Minimal impact of the straw addition was observed on performance in both CWTS designs. This suggests the systems were not carbon-limited and forebays did not have an impact on COPI treatment.

8.8 HYDROSOIL

The substrate used in the pilot CWTS was a mixture of 90% medium to coarse sand and 10% wood chips, with a porosity of 23%. The sand allowed water to interact with the root zones and promoted reducing conditions in the substrate, as was seen by the consistently reducing conditions measured in the substrate of both CWTS designs. The medium to coarse sand used in the pilot CWTS consisted of grains with a diameter between 0.2 to 1 mm and a critical resuspension linear flow velocity of 2 to 10 cm/s. This critical resuspension velocity is less than the flow rate targeted in a CWTS, preventing resuspension of sand and mineralized contaminants. A medium to coarse sand substrate is also recommended for the on site CWTS, but any selected substrate will require pre-screening for metal content.

The addition of wood chips to the substrate provided a source of carbon for the microbial communities to develop as the CWTS matures, as the vegetation would be unable to provide the required level of carbon until sufficiently established. As discussed in Section 8.6, the substrate of both CWTS contained the highest percentages of desired microbes including SPBs, SeRBs, and URBs when compared to the moss and root samples. This indicates the substrate is an important area of COPI treatment and that the microbial communities were able to establish well, likely aided by the wood chip addition. Carbon amendments (10% by volume) are therefore recommended in the substrate of the on site CWTS, again with proper pre-screening of considered materials to prevent leaching of metals from the substrate into the CWTS.

8.9 DETRITUS AND ACCRETION

The detritus study was conducted to assess the decomposition rates of bulrush and water sedge in the CWTS designs over time (Section 6.11; Chimney and Pietro, 2006; Hammerly et al., 1989). Carbon cycles through a wetland by accumulation into the plants during photosynthesis, and release through plant decomposition (USEPA, 2008). The rate of decomposition and nutrient release is dependent on many factors, such as plant type, HRT, and environmental conditions (USEPA, 2008), and is therefore assessed through site-specific testing. The rate of decomposition is important in a CWTS to determine the amount of organic matter that will be broken down and become available as organic carbon, and the amount that will contribute to accretion. Accretion is the gradual accumulation of additional layers of organic matter, which aids in building new substrate in the CWTS from undecomposed plant tissues (Section 5.1.2). It is an important process in the CWTS as it buries treated minerals making them more stable and maintains low overall concentrations of metals.

The results show that 83% and 71% decomposition occurs for bulrush and water, respectively, over a period roughly equivalent to one operational season (i.e., from spring start up to fall shut down, comparable to the 112-day sampling event; Figure 8-44; Appendix A, Table A7-1). This suggests that the plant material is successfully being broken down in the CWTS to promote reducing conditions and provide the organic carbon and nutrients needed by beneficial microbes for treatment. Decomposition rates slowed substantially over time, with minimal changes from day 112 to day 199 with the water which had 72% decomposition by day 199 (Figure 8-44). Similarly, decomposition rates slowed for the bulrush which had greater overall decomposition at 93% by day 199 (Figure 8-44). There was no significant carbon contribution from periphyton growth on the polyester filter fibre material bags in the detritus study.

Through the duration of the pilot-scale CWTS trial, bulrush and water sedge produced an average of 0.15 and 0.91 kg of dry weight per meter squared, respectively. The plant material did not completely decompose after a time period equivalent to an operating season, suggesting accretion in the wetland would occur as more organics are produced in a year than decompose (Figure 8-44). The accretion and decomposition rates reported here are intended to be refined through the on site demonstration-scale CWTS.

Direct measurement of the vertical accretion at the end of testing indicated that more accretion occurred in the water sedge CWTS (approximately 4 cm) than the bulrush CWTS (approximately 2 cm), with root growth and development being the primary contributor over decomposition of organic material (Photograph 8-6). Generally, high amounts of accretion from root growth is expected early on but would decrease as the CWTS matures. The vertical accretion seen in the isolated treatment cells of the CWTS may not be fully representative of the accretion which would occur in an open, full-scale system, with vertical accretion intended to be further evaluated through the on site demonstration-scale CWTS.

Figure 8-44: Percent Decomposition of Plant Material in Constructed Wetland Treatment System Over Time

Decomposition was measured by the decrease in dry mass of the bulrush and water sedge material over time.

Photograph 8-6: Water Sedge (Left) and Bulrush (Right) Cut Open at the end of Operations Phase to Show Accretion and Root Mats

9 SUMMARY OF KEY FINDINGS

The pilot-scale CWTS testing addressed several important design considerations regarding implementation of a CWTS for treatment of COPIs at the Project. COPIs (arsenic, antimony, cadmium, copper, lead, selenium, uranium, and zinc) were assessed for extent of treatment as well as the fate, stability, and distribution of treated COPIs in the CWTS.

The pilot-scale testing has provided additional proof-of-concept for CWTS for the Project, demonstrating notable treatment of all COPIs. The pilot-scale testing successfully evaluated two CWTS designs with different plant types, using a “worst case” scenario from the ABM Lake WQM, which assumes a reduced treatment efficiency in the lake.

The strengths and considerations of each CWTS design are summarized in Table 9-1, and the key findings are summarized as:

- The water sedge design achieved and maintained reducing conditions throughout pilot-scale testing, whereas the bulrush design was not able to consistently achieve targeted reducing conditions.
- The targeted explanatory parameters for the CWTS were optimized through monitoring during pilot-scale CWTS commissioning and operations. ORP targets will be revised for future on site CWTS.
- Treatment of COPIs was more effective in the water sedge CWTS compared to the bulrush CWTS, with higher removal rate coefficients (RRC) and lower outflow concentrations in the water sedge CWTS for all COPIs.
- Cadmium, lead, arsenic, zinc and selenium were treated below the receiving environment WQO in both designs.
- Copper, antimony, and uranium were treated below receiving environment WQO in the water sedge CWTS only.
- COPIs were generally stable through freeze-thaw testing.
- Stagnation testing revealed increases in antimony, arsenic, and uranium in the A cell of the water sedge CWTS during the stagnation period and initial flush of water through the system, with subsequent treatment observed as water flowed through the system. Treatment of these COPIs subsequently recovered rapidly to levels observed before the stagnation trial. Most of these COPIs decreased or were not affected in the bulrush CWTS, while uranium increased and was minimally treated through the bulrush system. Stagnation had minimal impact on cadmium, copper, lead, and zinc.
- Minimal plant uptake of COPIs was observed as targeted, which is a critical component in the CWTSs.
- Beneficial sulphide-producing, selenium-reducing, and uranium-reducing bacteria were found in all CWTS designs, supporting the presence of targeted treatment mechanisms. These beneficial bacteria were promoted from the plants collected from the site and regional area in 2018 for use in the pilot-scale CWTS.
- The coarse sand and wood chip substrate used in the pilot-scale CWTS promoted desired reducing conditions in the substrate of both CWTS and supported beneficial microbial growth.
- Vegetation established well in both CWTS, with more dense growth in the water sedge design than the bulrush design. Based on the decomposition rates of bulrush and water sedge, accretion is expected to occur in the CWTS.

Table 9-1: Summary of Strengths, Considerations, and Recommendations for Constructed Wetland Treatment System Designs

CWTS Design	Strengths	Considerations	Recommendation
Bulrush	- More tolerant to deep water resulting in smaller footprint. - Minimal release of most COPIs through stagnation. - Excess AVS produced for stabilizing COPI treatment during temperature and biological fluctuations. - More COPIs retained in organics compared to water sedge CWTS, likely due to better moss establishment. - Desired microbial populations (SPBs, SeRBs, URBs) established in the root zones and substrate.	- Variable treatment of COPIs, with minimal treatment during high flow events. - Slower removal rates than water sedge design - Did not maintain targeted reducing conditions throughout operations. - Limited SPBs and URBs associated with the moss.	Not recommended
Water sedge	- Best treatment of all COPIs during all flow regimes, with COPIs treated to below receiving environment WQOs at most flow regimes. - Faster establishment of reducing conditions and maintained targeted conditions throughout operations. - More AVS created compared to bulrush. - Excess AVS produced for stabilizing COPI treatment during temperature and biological fluctuations. - Produced more biomass per year for carbon addition to the CWTS. - Desired microbial populations (SPBs, SeRBs, URBs) established in the moss, root zones, and substrate.	- More release of COPIs during stagnation, with subsequent treatment observed as water flowed through the system and rapid recovery of treatment. - Requires shallower water depth than bulrush, however, had faster COPI removal rates which helps minimize CWTS footprint required for treatment. - Larger impact of evapotranspiration during low flow regimes, which will be evaluated through full-scale CWTS sizing.	Recommended system for on site

10 RECOMENDATIONS AND NEXT STEPS

Pilot-scale testing has provided additional proof-of-concept for CWTS for the Project, demonstrating notable treatment of COPIs. The work addressed several important design and commissioning considerations for implementation for a full-scale CWTS. These include selection of suitable vegetation, soils, and requirements for effective commissioning.

Both water sedge and bulrush designs demonstrated treatment of COPIs, although treatment in the water sedge CWTS was consistently more efficient. The pilot-scale CWTS has demonstrated the water sedge CWTS design is capable of treating COPIs in the 2018 “worst-case” WQM scenario from ABM Lake to below the receiving environment WQOs. As a result, the water sedge CWTS design appears to be appropriate to use as the primary contingency measure for the maintenance of water quality for the Project in Post-closure.

It is recommended that the information presented in this report be used to support the CWTS design as a contingency measure in the RCP. This includes refining CWTS sizing based on the COPI RRCs developed for the Project through the

pilot-scale test work and updated water quality models for the Project. Future work should include the next phases of CWTS design and implementation, including on site demonstration-scale optimization to further refine design and testing under site specific influences.

All removal rate coefficients are first order (day⁻¹). Bulrush series: 1, 2, 3; Water sedge series: 4, 5, 6.

'--' not measured in that flow period. NA could not be calculated due to low concentrations.

¹ There was insufficient resolution to confidently determine the RRC for Thallium; however, thallium treatment is not needed in the CWTS.

Bulrush series: 1, 2, 3; Water sedge series: 4, 5, 6.

All sampling events occurred in 2019.

'--' not measured in that sampling event. NA could not be calculated due to low concentrations.

¹ There was insufficient resolution to confidently determine the RRC for Thallium; however, thallium treatment is not needed in the CWTS.

A1. STAGNATION TESTING

Table A1-1: Water Loss During Stagnation Trials Measured as Increase in Depth From Top of Cell Barrel to Water Surface in cm

Date	Depth from top of cell to water in cm

Dry weight of plant material after removed from bag and rinsed as per methodology.

¹ Location of bag within CWTS

² Bag label: D: detritus (bulrush or water sedge material); P: polyester (control material); R: reduced weight bag (initial mass 3 g rather than 5 g);
1, 2, 3: replicate and order of removal

APPENDIX B.
Microbiology
Report *(provided*
in electronic format)

APPENDIX C.

Analytical Data

Water, soil, plant and organics data from Bureau Veritas are provided in the attached reports.

Commissioning (soil and water) results
Operations results
Operations with forebays results
Operations with very low flow results
Freeze testing results
Stagnation testing results
AVS/SEM, soil, tessier, and vegetation results

Remarks:

Maxxam Analytics' laboratories are accredited to ISO/IEC 17025:2005 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing. Maxxam is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by Maxxam, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be

Maxxam ID		VK3929	VK3930		
Sampling Date		2019/03/22 14:35	2019/03/22 14:40		
COC Number		08466837	08466837		
	UNITS	5C	6C	RDL	QC Batch
Total Sodium (Na)	mg/L	30.3	33.1	0.25	9359686
Total Sulphur (S)	mg/L	83.7	89.5	3.0	9359686
RDL = Reportable Detection Limit					

Maxxam Job #: B921004
Report Date: 2019/04/01

ALEXCO ENVIRONMENTAL GROUP INC.
Client Project #: BMC-18-02

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	21.0°C
-----------	--------

Sample VK3924 [INFL-04] : Sample analyzed for digested low level metals due to sediment in sample. This results in an increased reportable detection limit for Al B Ba Bi Cr Co Cu Fe Mn Ni P Pb Sb Si Ti U V and Zn.

Sample VK3925 [1C] : Sample analyzed for digested low level metals due to sediment in sample. This results in an increased reportable detection limit for Al B Ba Bi Cr Co Cu Fe Mn Ni P Pb Sb Si Ti U V and Zn.

Sample VK3926 [2C] : Sample analyzed for digested low level metals due to sediment in sample. This results in an increased reportable detection limit for Al B Ba Bi Cr Co Cu Fe Mn Ni P Pb Sb Si Ti U V and Zn.

Sample VK3927 [3C] : Sample analyzed for digested low level metals due to sediment in sample. This results in an increased reportable detection limit for Al B Ba Bi Cr Co Cu Fe Mn Ni P Pb Sb Si Ti U V and Zn.

Sample VK3928 [4C] : Sample analyzed for digested low level metals due to sediment in sample. This results in an increased reportable detection limit for Al B Ba Bi Cr Co Cu Fe Mn Ni P Pb Sb Si Ti U V and Zn.

Sample VK3929 [5C] : Sample analyzed for digested low level metals due to sediment in sample. This results in an increased reportable detection limit for Al B Ba Bi Cr Co Cu Fe Mn Ni P Pb Sb Si Ti U V and Zn.

Sample VK3930 [6C] : Sample analyzed for digested low level metals due to sediment in sample. This results in an increased reportable detection limit for Al B Ba Bi Cr Co Cu Fe Mn Ni P Pb Sb Si Ti U V and Zn.

Sample VK3924, Elements by ICPMS Low Level (dissolved): Test repeated.

Sample VK3926, Elements by ICPMS Low Level (dissolved): Test repeated.

Sample VK3929, Elements by ICPMS Low Level (dissolved): Test repeated.

Sample VK3930, Elements by ICPMS Low Level (dissolved): Test repeated.

Results relate only to the items tested.

Maxxam Job #: B921004
Report Date: 2019/04/01

QUALITY ASSURANCE REPORT(CONT'D)

ALEXCO ENVIRONMENTAL GROUP INC.
Client Project #: BMC-18-02

QC Batch	Parameter	Date	Matrix Spike		Spiked Blank		Method Blank		RPD	
			% Recovery	QC Limits	% Recovery	QC Limits	Value	UNITS	Value (%)	QC Limits
9364957	Dissolved Silver (Ag)	2019/03/29			97	80 - 120	<0.0000050	mg/L		
9364957	Dissolved Uranium (U)	2019/03/29			100	80 - 120	<0.0000020	mg/L		

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

(1) Method blank exceeds acceptance limits for Ni- 2X RDL acceptable for low level metals determination.

Remarks:

Maxxam Analytics' laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing. Maxxam is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by Maxxam, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) This test was performed by Maxxam Vancouver

9388464	Dissolved Sulphate (SO4)	2019/04/18			101	80 - 120	<0.50	mg/L		

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

(1) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.

CERTIFICATE OF ANALYSIS

BV LABS JOB #: B944565

Received: 2019/06/06, 15:35

by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) This test was performed by BV Labs Vancouver

(2) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).

Encryption Key

Please direct all questions regarding this Certificate of Analysis to your Project Manager.

Safiann Maiter, Key Account Specialist

=====

BV Labs has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per section 5.10.2 of ISO/IEC 17025:2005(E), signing the reports. For Service Group specific validation please refer to the Validation Signature Page.

Nitrate + Nitrite-N (calculated) Low Lev	CALC	9458646	N/A	2019/06/13	Automated Statchk
Nitrogen (Nitrite - Nitrate) Low Level	IC/UV	9461772	N/A	2019/06/13	Parniyan Roosta
Sulphate - Low Level	KONE/COL	9464233	N/A	2019/06/13	Zafar Iqbal

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	1.7°C
-----------	-------

Sample VV6646 [1A] : Sample was analyzed past method specified hold time for Nitrogen (Nitrite - Nitrate) Low Level. Exceedance of hold time increases the uncertainty of test results but does not necessarily imply that results are compromised.

Sample VV6647 [1B] : Sample was analyzed past method specified hold time for Nitrogen (Nitrite - Nitrate) Low Level. Exceedance of hold time increases the uncertainty of test results but does not necessarily imply that results are compromised.

Sample VV6648 [1C] : Sample was analyzed past method specified hold time for Nitrogen (Nitrite - Nitrate) Low Level. Exceedance of hold time increases the uncertainty of test results but does not necessarily imply that results are compromised.

Sample VV6649 [2A] : Sample was analyzed past method specified hold time for Nitrogen (Nitrite - Nitrate) Low Level. Exceedance of hold time increases the uncertainty of test results but does not necessarily imply that results are compromised.

Sample VV6650 [2B] : Sample was analyzed past method specified hold time for Nitrogen (Nitrite - Nitrate) Low Level. Exceedance of hold time increases the uncertainty of test results but does not necessarily imply that results are compromised.

Sample VV6651 [2C] : Sample was analyzed past method specified hold time for Nitrogen (Nitrite - Nitrate) Low Level. Exceedance of hold time increases the uncertainty of test results but does not necessarily imply that results are compromised.

Sample VV6652 [3A] : Sample was analyzed past method specified hold time for Nitrogen (Nitrite - Nitrate) Low Level. Exceedance of hold time increases the uncertainty of test results but does not necessarily imply that results are compromised.

Sample VV6653 [3B] : Sample was analyzed past method specified hold time for Nitrogen (Nitrite - Nitrate) Low Level. Exceedance of hold time increases the uncertainty of test results but does not necessarily imply that results are compromised.

Sample VV6654 [3C] : Sample was analyzed past method specified hold time for Nitrogen (Nitrite - Nitrate) Low Level. Exceedance of hold time increases the uncertainty of test results but does not necessarily imply that results are compromised.

Sample VV6655 [INFL] : Sample was analyzed past method specified hold time for Nitrogen (Nitrite - Nitrate) Low Level. Exceedance of hold time increases the uncertainty of test results but does not necessarily imply that results are compromised.

Sample VV6641, Elements by ICPMS Low Level (dissolved): Test repeated.

Sample VV6642, Elements by ICPMS Low Level (dissolved): Test repeated.

Sample VV6644, Elements by ICPMS Low Level (dissolved): Test repeated.

Sample VV6641, Elements by ICPMS Low Level (total): Test repeated.

Sample VV6642, Elements by ICPMS Low Level (total): Test repeated.

Results relate only to the items tested.

BV Labs Job #: B944565
Report Date: 2019/06/18

QUALITY ASSURANCE REPORT(CONT'D)

ALEXCO ENVIRONMENTAL GROUP INC.
Client Project #: BMC-18-02
Site Location: KUDZ ZE KAVAH

QC Batch	Parameter	Date	Matrix Spike		Spiked Blank		Method Blank		RPD	
			% Recovery	QC Limits	% Recovery	QC Limits	Value	UNITS	Value (%)	QC Limits
9464523	Alkalinity (Total as CaCO3)	2019/06/13	104	80 - 120	96	80 - 120	<0.50	mg/L	0.73	20
9464523	Bicarbonate (HCO3)	2019/06/13					<0.50	mg/L	0.73	20
9464523	Carbonate (CO3)	2019/06/13					<0.50	mg/L	NC	20
9464523	Hydroxide (OH)	2019/06/13					<0.50	mg/L	NC	20

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

VALIDATION SIGNATURE PAGE

The analytical data and all QC contained in this report were reviewed and validated by the following individual(s).

David Huang, M.Sc., P.Chem., QP, Scientific Services Manager

Ghayasuddin Khan, M.Sc., P.Chem., QP, Scientific Specialist, Inorganics

BV Labs has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per section 5.10.2 of ISO/IEC 17025:2005(E), signing the reports. For Service Group specific validation please refer to the Validation Signature Page.

Burnaby: 4606 Canada Way, Burnaby, BC V5G 1K5, Toll Free (800) 665-8566

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Report Date: 2019/07/16
Report #: R2752962
Version: 1 - Final

CERTIFICATE OF ANALYSIS

BV LABS JOB #: B954277

Received: 2019/07/05, 15:30

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).

Encryption Key

Please direct all questions regarding this Certificate of Analysis to your Project Manager.

Safiann Maiter, Key Account Specialist

=====

BV Labs has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per ISO/IEC 17025, signing the reports. For Service Group specific validation please refer to the Validation Signature Page.

QUALITY ASSURANCE REPORT(CONT'D)

ALEXCO ENVIRONMENTAL GROUP INC.
Client Project #: BMC-18-02
Site Location: KUDZ ZE KAVAH

QC Batch	Parameter	Date	Matrix Spike		Spiked Blank		Method Blank		RPD	
			% Recovery	QC Limits	% Recovery	QC Limits	Value	UNITS	Value (%)	QC Limits
9503962	Dissolved Sulphate (SO4)	2019/07/12	NC	80 - 120	102	80 - 120	<0.50	mg/L	0.076	20
Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.										
Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.										
Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.										
Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.										
NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)										
NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).										
(1) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.

VALIDATION SIGNATURE PAGE

The analytical data and all QC contained in this report were reviewed and validated by the following individual(s).

Ghayasuddin Khan, M.Sc., P.Chem., QP, Scientific Specialist, Inorganics

Harry (Peng) Liang, Senior Analyst

BV Labs has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per ISO/IEC 17025, signing the reports. For Service Group specific validation please refer to the Validation Signature Page.

CERTIFICATE OF ANALYSIS

BV LABS JOB #: B960531

Received: 2019/07/24, 14:57

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

- (1) This test was performed by BV Labs Vancouver
- (2) DOC present in the sample should be considered as non-purgeable DOC. Dissolved > Total Imbalance: When applicable, Dissolved and Total results were reviewed and data quality meets acceptable levels unless otherwise noted.
- (3) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).
- (4) TOC present in the sample should be considered as non-purgeable TOC.

Encryption Key

Please direct all questions regarding this Certificate of Analysis to your Project Manager.

=====

BV Labs has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per ISO/IEC 17025, signing the reports. For Service Group specific validation please refer to the Validation Signature Page.

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	16.0°C
-----------	--------

Sample WE0957 [5B] : Sample analyzed for digested low level metals due to sediment in sample. This results in an increased reportable detection limit for Al B Ba Bi Cr Co Cu Fe Mn Ni P Pb Sb Si Ti U V and Zn.

Sample WE0958 [5C] : Sample analyzed for digested low level metals due to sediment in sample. This results in an increased reportable detection limit for Al B Ba Bi Cr Co Cu Fe Mn Ni P Pb Sb Si Ti U V and Zn.

Sample WE0918, Elements by ICPMS Low Level (dissolved): Test repeated.

Results relate only to the items tested.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

(1) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.

VALIDATION SIGNATURE PAGE

The analytical data and all QC contained in this report were reviewed and validated by the following individual(s).

David Huang, M.Sc., P.Chem., QP, Scientific Services Manager

Harry (Peng) Liang, Senior Analyst

BV Labs has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per ISO/IEC 17025, signing the reports. For Service Group specific validation please refer to the Validation Signature Page.

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

CERTIFICATE OF ANALYSIS

BV LABS JOB #: B965831

Received: 2019/08/09, 13:30

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).

(2) The CCME method requires pH to be analysed within 15 minutes of sampling and therefore field analysis is required for compliance. All Laboratory pH analyses in this report are reported past the CCME holding time. Bureau Veritas Laboratories endeavours to analyze samples as soon as possible after receipt.

Encryption Key

Please direct all questions regarding this Certificate of Analysis to your Project Manager.

N/A = Not Applicable

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

(1) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

CERTIFICATE OF ANALYSIS

BV LABS JOB #: B967670

Received: 2019/08/14, 13:00

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).

Encryption Key

Please direct all questions regarding this Certificate of Analysis to your Project Manager.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

(1) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing.

CERTIFICATE OF ANALYSIS

BV LABS JOB #: B968928

Received: 2019/08/19, 12:39

BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).

(2) The CCME method requires pH to be analysed within 15 minutes of sampling and therefore field analysis is required for compliance. All Laboratory pH analyses in this report are reported past the CCME holding time. Bureau Veritas Laboratories endeavours to analyze samples as soon as possible after receipt.

Encryption Key

N/A = Not Applicable

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

(1) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless

indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) DOC present in the sample should be considered as non-purgeable DOC. Dissolved > Total Imbalance: When applicable, Dissolved and Total results were reviewed and data quality meets acceptable levels unless otherwise noted.

(2) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).

(3) TOC present in the sample should be considered as non-purgeable TOC.

RDL = Reportable Detection Limit

N/A = Not Applicable

(1) Sample analyzed past hold time. Sample analysis is recommended within 48 hours of sampling.

(2) Detection limits raised due to dilution to bring analyte within the calibrated range.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

(1) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

CERTIFICATE OF ANALYSIS

BV LABS JOB #: B975892

Received: 2019/09/09, 12:50

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) This test was performed by BV Labs Vancouver

(2) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).

(3) The CCME method requires pH to be analysed within 15 minutes of sampling and therefore field analysis is required for compliance. All Laboratory pH analyses in this report are reported past the CCME holding time. Bureau Veritas Laboratories endeavours to analyze samples as soon as possible after receipt.

Encryption Key

Please direct all questions regarding this Certificate of Analysis to your Project Manager.

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	19.0°C
Package 2	5.3°C
Package 3	4.3°C

Sample WL6370, Elements by ICPMS Low Level (dissolved): Test repeated.

Sample WL6382, Elements by ICPMS Low Level (dissolved): Test repeated.

Results relate only to the items tested.

N/A = Not Applicable

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

VALIDATION SIGNATURE PAGE

The analytical data and all QC contained in this report were reviewed and validated by the following individual(s).

Ghayasuddin Khan, M.Sc., P.Chem., QP, Scientific Specialist, Inorganics

Rob Reinert, B.Sc., Scientific Spécialist

BV Labs has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per ISO/IEC 17025, signing the reports.
For Service Group specific validation please refer to the Validation Signature Page.

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing.

CERTIFICATE OF ANALYSIS

BV LABS JOB #: B976638

Received: 2019/09/12, 09:00

BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) This test was performed by BV Labs Vancouver

(2) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).

Encryption Key

Please direct all questions regarding this Certificate of Analysis to your Project Manager.

Safiann Maiter, Key Account Specialist

=====

BV Labs has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per ISO/IEC 17025, signing the reports. For Service Group specific validation please refer to the Validation Signature Page.

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	6.7°C
Package 2	4.7°C

Sample WL9981 [4A] : Sample analyzed for digested low level metals due to sediment in sample. This results in an increased reportable detection limit for Al B Ba Bi Cr Co Cu Fe Mn Ni P Pb Sb Si Ti U V and Zn.

Sample WL9984 [5A] : Sample analyzed for digested low level metals due to sediment in sample. This results in an increased reportable detection limit for Al B Ba Bi Cr Co Cu Fe Mn Ni P Pb Sb Si Ti U V and Zn.

Sample WL9985 [5B] : Sample analyzed for digested low level metals due to sediment in sample. This results in an increased reportable detection limit for Al B Ba Bi Cr Co Cu Fe Mn Ni P Pb Sb Si Ti U V and Zn.

Results relate only to the items tested.

QUALITY ASSURANCE REPORT(CONT'D)

BMC MINERAL (NO. 1) LTD.
Client Project #: BMC-18-02
Site Location: KUDZ ZE KAVAH

QC Batch	Parameter	Date	Matrix Spike		Spiked Blank		Method Blank		RPD	
			% Recovery	QC Limits	% Recovery	QC Limits	Value	UNITS	Value (%)	QC Limits
9591436	Dissolved Sulphate (SO4)	2019/09/17	NC	80 - 120	99	80 - 120	<0.50	mg/L	0.81	20
Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.										
Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.										
Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.										
Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.										
NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)										
NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

VALIDATION SIGNATURE PAGE

The analytical data and all QC contained in this report were reviewed and validated by the following individual(s).

Ghayasuddin Khan, M.Sc., P.Chem., QP, Scientific Specialist, Inorganics

Rob Reinert, B.Sc., Scientific Spécialist

BV Labs has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per ISO/IEC 17025, signing the reports.
For Service Group specific validation please refer to the Validation Signature Page.

Version: 1 - Final

CERTIFICATE OF ANALYSIS

BV LABS JOB #: B977477

Received: 2019/09/13, 11:49

by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) This test was performed by BV Labs Vancouver

(2) DOC present in the sample should be considered as non-purgeable DOC. Dissolved > Total Imbalance: When applicable, Dissolved and Total results were reviewed and data quality meets acceptable levels unless otherwise noted.

(3) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).

(4) TOC present in the sample should be considered as non-purgeable TOC.

Encryption Key

Please direct all questions regarding this Certificate of Analysis to your Project Manager.

9596595	Acidity (pH 8.3)	2019/09/19			108	80 - 120	<1.0	mg/L	2.3	20

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

(1) Method blank exceeds acceptance limits for U - 2X RDL acceptable for low level metals determination.

(2) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.

VALIDATION SIGNATURE PAGE

The analytical data and all QC contained in this report were reviewed and validated by the following individual(s).

Andy Lu, Ph.D., P.Chem., Scientific Specialist

Ghayasuddin Khan, M.Sc., P.Chem., QP, Scientific Specialist, Inorganics

Harry (Peng) Liang, Senior Analyst

BV Labs has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per ISO/IEC 17025, signing the reports. For Service Group specific validation please refer to the Validation Signature Page.

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

CERTIFICATE OF ANALYSIS

BV LABS JOB #: B985408

Received: 2019/10/04, 14:31

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) This test was performed by BV Labs Calgary Environmental

(2) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).

Encryption Key

Please direct all questions regarding this Certificate of Analysis to your Project Manager.

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	7.3°C
-----------	-------

Sample WQ4891 [INFLUENT] : Sample was analyzed past method specified hold time for Nitrate+Nitrite (N) (low level). Exceedance of hold time increases the uncertainty of test results but does not necessarily imply that results are compromised. Sample was analyzed past method specified hold time for Nitrite (N) (low level).

Sample WQ4892 [1A] : Sample was analyzed past method specified hold time for Nitrate+Nitrite (N) (low level). Exceedance of hold time increases the uncertainty of test results but does not necessarily imply that results are compromised. Sample was analyzed past method specified hold time for Nitrite (N) (low level).

Sample WQ4893 [1B] : Sample was analyzed past method specified hold time for Nitrate+Nitrite (N) (low level). Exceedance of hold time increases the uncertainty of test results but does not necessarily imply that results are compromised. Sample was analyzed past method specified hold time for Nitrite (N) (low level).

Sample WQ4894 [1C] : Sample was analyzed past method specified hold time for Nitrate+Nitrite (N) (low level). Exceedance of hold time increases the uncertainty of test results but does not necessarily imply that results are compromised. Sample was analyzed past method specified hold time for Nitrite (N) (low level).

Sample WQ4895 [3A] : Sample was analyzed past method specified hold time for Nitrate+Nitrite (N) (low level). Exceedance of hold time increases the uncertainty of test results but does not necessarily imply that results are compromised. Sample was analyzed past method specified hold time for Nitrite (N) (low level).

Sample WQ4896 [3B] : Sample was analyzed past method specified hold time for Nitrate+Nitrite (N) (low level). Exceedance of hold time increases the uncertainty of test results but does not necessarily imply that results are compromised. Sample was analyzed past method specified hold time for Nitrite (N) (low level).

Sample WQ4897 [3C] : Sample was analyzed past method specified hold time for Nitrate+Nitrite (N) (low level). Exceedance of hold time increases the uncertainty of test results but does not necessarily imply that results are compromised. Sample was analyzed past method specified hold time for Nitrite (N) (low level).

Sample WQ4898 [4A] : Sample was analyzed past method specified hold time for Nitrate+Nitrite (N) (low level). Exceedance of hold time increases the uncertainty of test results but does not necessarily imply that results are compromised. Sample was analyzed past method specified hold time for Nitrite (N) (low level).

Sample WQ4899 [4B] : Sample was analyzed past method specified hold time for Nitrate+Nitrite (N) (low level). Exceedance of hold time increases the uncertainty of test results but does not necessarily imply that results are compromised. Sample was analyzed past method specified hold time for Nitrite (N) (low level).

Sample WQ4900 [4C] : Sample was analyzed past method specified hold time for Nitrate+Nitrite (N) (low level). Exceedance of hold time increases the uncertainty of test results but does not necessarily imply that results are compromised. Sample was analyzed past method specified hold time for Nitrite (N) (low level).

Sample WQ4901 [6A] : Sample was analyzed past method specified hold time for Nitrate+Nitrite (N) (low level). Exceedance of hold time increases the uncertainty of test results but does not necessarily imply that results are compromised. Sample was analyzed past method specified hold time for Nitrite (N) (low level).

Sample WQ4902 [6B] : Sample was analyzed past method specified hold time for Nitrate+Nitrite (N) (low level). Exceedance of hold time increases the uncertainty of test results but does not necessarily imply that results are compromised. Sample was analyzed past method specified hold time for Nitrite (N) (low level).

Sample WQ4903 [6C] : Sample was analyzed past method specified hold time for Nitrate+Nitrite (N) (low level). Exceedance of hold time increases the uncertainty of test results but does not necessarily imply that results are compromised. Sample was analyzed past method specified hold time for Nitrite (N) (low level).

QUALITY ASSURANCE REPORT(CONT'D)

ALEXCO ENVIRONMENTAL GROUP INC.
Client Project #: BMC-18-02
Site Location: KUDZ ZE KAVAH

QC Batch	Parameter	Date	Matrix Spike		Spiked Blank		Method Blank		RPD	
			% Recovery	QC Limits	% Recovery	QC Limits	Value	UNITS	Value (%)	QC Limits
9621618	Alkalinity (PP as CaCO3)	2019/10/10					<0.50	mg/L	NC	20
9621618	Alkalinity (Total as CaCO3)	2019/10/10	NC	80 - 120	98	80 - 120	<0.50	mg/L	0.46	20
9621618	Bicarbonate (HCO3)	2019/10/10					<0.50	mg/L	0.46	20
9621618	Carbonate (CO3)	2019/10/10					<0.50	mg/L	NC	20
9621618	Hydioxide (OH)	2019/10/10					<0.50	mg/L	NC	20
9624592	Dissolved Lead (Pb)	2019/10/11			106	80 - 120	<0.0000050	mg/L		

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

(1) Method blank exceeds acceptance limits for As- 2X RDL acceptable for low level metals determination.

(2) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and

Received: 2019/10/21, 14:16

use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) This test was performed by BV Labs Vancouver

(2) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

VALIDATION SIGNATURE PAGE

The analytical data and all QC contained in this report were reviewed and validated by the following individual(s).

Ghayasuddin Khan, M.Sc., P.Chem., QP, Scientific Specialist, Inorganics

Rob Reinert, B.Sc., Scientific Spécialist

BV Labs has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per ISO/IEC 17025, signing the reports.
For Service Group specific validation please refer to the Validation Signature Page.

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All

CERTIFICATE OF ANALYSIS

BV LABS JOB #: B996415

Received: 2019/11/06, 15:33

data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

- (1) This test was performed by BV Labs Vancouver
- (2) DOC present in the sample should be considered as non-purgeable DOC. Dissolved > Total Imbalance: When applicable, Dissolved and Total results were reviewed and data quality meets acceptable levels unless otherwise noted.
- (3) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).
- (4) TOC present in the sample should be considered as non-purgeable TOC.

Encryption Key

Please direct all questions regarding this Certificate of Analysis to your Project Manager.

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	3.7°C
Package 2	3.0°C

Results relate only to the items tested.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

(1) oct10

(2) nov11

(3) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been

CERTIFICATE OF ANALYSIS

BV LABS JOB #: B998124

Received: 2019/11/13, 08:40

accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) This test was performed by BV Labs Vancouver

(2) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).

Encryption Key

Please direct all questions regarding this Certificate of Analysis to your Project Manager.

Sampler Initials: BR

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	11.7°C
-----------	--------

Results relate only to the items tested.

Sampler Initials: BR

QC Batch	Parameter	Date	Matrix Spike		Spiked Blank		Method Blank		RPD	
			% Recovery	QC Limits	% Recovery	QC Limits	Value	UNITS	Value (%)	QC Limits
9673718	Total Vanadium (V)	2019/11/16	99	80 - 120	100	80 - 120	<0.00020	mg/L	NC	20
9673718	Total Zinc (Zn)	2019/11/16	NC	80 - 120	100	80 - 120	<0.00010	mg/L	1.2	20
9673718	Total Zirconium (Zr)	2019/11/16	104	80 - 120	98	80 - 120	<0.00010	mg/L	NC	20
9675613	Dissolved Sulphate (SO4)	2019/11/18	199	80 - 120	103	80 - 120	0.55, RDL=0.50	mg/L	3.5	20
9676117	Total Ammonia (N)	2019/11/19	93	80 - 120	99	80 - 120	<0.0050	mg/L	9.0	20
9676160	Total Ammonia (N)	2019/11/19	93	80 - 120	97	80 - 120	<0.0050	mg/L	1.9	20
9679714	Dissolved Sulphate (SO4)	2019/11/20			106	80 - 120	<0.50	mg/L		

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

(1) Method blank exceeds acceptance limits for Tl- 2X RDL acceptable for low level metals determination.

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied.

CERTIFICATE OF ANALYSIS

BV LABS JOB #: B999326

Received: 2019/11/18, 12:21

BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) This test was performed by BV Labs Vancouver

(2) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).

Encryption Key

Please direct all questions regarding this Certificate of Analysis to your Project Manager.

9678003	Total Zirconium (Zr)	2019/11/20	106	80 - 120	104	80 - 120	<0.00010	mg/L	NC	20
9678922	Total Ammonia (N)	2019/11/20	113	80 - 120	103	80 - 120	<0.0050	mg/L	2.2	20
9678939	Total Ammonia (N)	2019/11/20	109	80 - 120	110	80 - 120	<0.0050	mg/L	NC	20
9679014	Dissolved Chloride (Cl)	2019/11/19	NC	80 - 120	103	80 - 120	<0.50	mg/L	3.6	20
9679014	Dissolved Sulphate (SO4)	2019/11/19	NC	80 - 120	105	80 - 120	0.59, RDL=0.50	mg/L	12	20
9679234	Total Ammonia (N)	2019/11/20	90	80 - 120	111	80 - 120	<0.0050	mg/L	0.34	20
9682642	Dissolved Chloride (Cl)	2019/11/22			103	80 - 120	<0.50	mg/L		
9682642	Dissolved Sulphate (SO4)	2019/11/22			102	80 - 120	<0.50	mg/L		

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

(1) Method blank exceeds acceptance limits for TI- 2X RDL acceptable for low level metals determination.

indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) This test was performed by BV Labs Calgary Environmental

(2) DOC present in the sample should be considered as non-purgeable DOC. Dissolved > Total Imbalance: When applicable, Dissolved and Total results were reviewed and data quality meets acceptable levels unless otherwise noted.

(3) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).

(4) TOC present in the sample should be considered as non-purgeable TOC.

RDL = Reportable Detection Limit

(1) Detection limits raised due to dilution to bring analyte within the calibrated range.

(2) Due to the sample matrix, sample required dilution. Detection limit was adjusted accordingly.

RDL = Reportable Detection Limit

(1) Detection limits raised due to dilution to bring analyte within the calibrated range.

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	16.0°C
Package 2	15.7°C

Sample WZ7980 [INFLUENT-67] : Sample was analyzed past method specified hold time for Biochemical Oxygen Demand. Exceedance of hold time increases the uncertainty of test results but does not necessarily imply that results are compromised.

Sample WZ7983 [1C] : Sample was analyzed past method specified hold time for Biochemical Oxygen Demand. Exceedance of hold time increases the uncertainty of test results but does not necessarily imply that results are compromised.

Sample WZ7986 [3C] : Sample was analyzed past method specified hold time for Biochemical Oxygen Demand. Exceedance of hold time increases the uncertainty of test results but does not necessarily imply that results are compromised.

Sample WZ7989 [4C] : Sample was analyzed past method specified hold time for Biochemical Oxygen Demand. Exceedance of hold time increases the uncertainty of test results but does not necessarily imply that results are compromised.

Sample WZ7992 [6C] : Sample was analyzed past method specified hold time for Biochemical Oxygen Demand. Exceedance of hold time increases the uncertainty of test results but does not necessarily imply that results are compromised.

Results relate only to the items tested.

9689189	Dissolved Chloride (Cl)	2019/11/27	97	80 - 120	104	80 - 120	<0.50	mg/L	8.2	20
9689189	Dissolved Sulphate (SO4)	2019/11/27	98	80 - 120	105	80 - 120	<0.50	mg/L	4.0	20
9695734	Alkalinity (PP as CaCO3)	2019/12/04					<0.50	mg/L	NC	20
9695734	Alkalinity (Total as CaCO3)	2019/12/04	NC	80 - 120	96	80 - 120	<0.50	mg/L	1.8	20
9695734	Bicarbonate (HCO3)	2019/12/04					<0.50	mg/L	1.8	20
9695734	Carbonate (CO3)	2019/12/04					<0.50	mg/L	NC	20
9695734	Hydroxide (OH)	2019/12/04					<0.50	mg/L	NC	20

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

(1) Method blank exceeds acceptance limits for Pb- 2X RDL acceptable for low level metals determination.

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

CERTIFICATE OF ANALYSIS

BV LABS JOB #: B9A3685

Received: 2019/12/02, 13:11

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) This test was performed by BV Labs Calgary Environmental

(2) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).

Encryption Key

Please direct all questions regarding this Certificate of Analysis to your Project Manager.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

CERTIFICATE OF ANALYSIS

BV LABS JOB #: B9A4734

Received: 2019/12/05, 10:00

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) This test was performed by BV Labs Calgary Environmental

(2) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).

Encryption Key

Please direct all questions regarding this Certificate of Analysis to your Project Manager.

=====

BV Labs has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per ISO/IEC 17025, signing the reports. For Service Group specific validation please refer to the Validation Signature Page.

Site Location: KUDZ ZE KAVAH

QC Batch	Parameter	Date	Matrix Spike		Spiked Blank		Method Blank		RPD	
			% Recovery	QC Limits	% Recovery	QC Limits	Value	UNITS	Value (%)	QC Limits
9701667	Total Ammonia (N)	2019/12/09	90	80 - 120	95	80 - 120	<0.0050	mg/L	0.038	20
Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.										
Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.										
Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.										
Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.										
NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)										
NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless

CERTIFICATE OF ANALYSIS

BV LABS JOB #: B9A5240

Received: 2019/12/06, 10:00

indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

- (1) This test was performed by BV Labs Vancouver
- (2) DOC present in the sample should be considered as non-purgeable DOC. Dissolved > Total Imbalance: When applicable, Dissolved and Total results were reviewed and data quality meets acceptable levels unless otherwise noted.
- (3) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).
- (4) TOC present in the sample should be considered as non-purgeable TOC.

RDL = Reportable Detection Limit

N/A = Not Applicable

(1) Detection limits raised due to dilution to bring analyte within the calibrated range.

(2) Due to the sample matrix, sample required dilution. Detection limit was adjusted accordingly.

TEST SUMMARY

BV Labs ID: XB7177 Dup
Sample ID: 6C
Matrix: Water

Collected: 2019/12/06
Shipped:
Received: 2019/12/06

Test Description	Instrumentation	Batch	Extracted	Date Analyzed	Analyst
Elements by ICPMS Low Level (dissolved)	ICP/CRCM	9702078	N/A	2019/12/10	Valentina Balada
Elements by ICPMS Low Level (total)	ICP/CRCM	9704052	N/A	2019/12/11	Valentina Balada

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	14.3°C
-----------	--------

Results relate only to the items tested.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

VALIDATION SIGNATURE PAGE

The analytical data and all QC contained in this report were reviewed and validated by the following individual(s).

David Huang, M.Sc., P.Chem., QP, Scientific Services Manager

Ghayasuddin Khan, M.Sc., P.Chem., QP, Scientific Specialist, Inorganics

Harry (Peng) Liang, Senior Analyst

Rob Reinert, B.Sc., Scientific Spécialist

BV Labs has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per ISO/IEC 17025, signing the reports. For Service Group specific validation please refer to the Validation Signature Page.

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been

Version: 1 - Final

CERTIFICATE OF ANALYSIS

BV LABS JOB #: B986526

Received: 2019/10/08, 13:46

accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) This test was performed by BV Labs Vancouver

(2) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).

Encryption Key

Please direct all questions regarding this Certificate of Analysis to your Project Manager.

Safiann Maiter, Key Account Specialist

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	20.0°C
-----------	--------

Sample WR0689 [5B] : Sample analyzed for digested low level metals due to sediment in sample. This results in an increased reportable detection limit for Al B Ba Bi Cr Co Cu Fe Mn Ni P Pb Sb Si Ti U V and Zn.

LOW LEVEL TOTAL METALS IN WATER (WATER) Comments

Matrix Spike Elements by ICPMS Digested LL (total): RDL raised due to concentration over linear range, sample dilution required.

Results relate only to the items tested.

QUALITY ASSURANCE REPORT(CONT'D)

ALEXCO ENVIRONMENTAL GROUP INC.
Client Project #: BMC-18-02
Site Location: KUDZ ZE KAVAH
Sampler Initials: BR

QC Batch	Parameter	Date	Matrix Spike		Spiked Blank		Method Blank		RPD	
			% Recovery	QC Limits	% Recovery	QC Limits	Value	UNITS	Value (%)	QC Limits
9626443	Alkalinity (Total as CaCO ₃)	2019/10/13	NC	80 - 120	97	80 - 120	<0.50	mg/L	1.2	20
9626443	Bicarbonate (HCO ₃)	2019/10/13					<0.50	mg/L	1.2	20
9626443	Carbonate (CO ₃)	2019/10/13					<0.50	mg/L	NC	20
9626443	Hydioxide (OH)	2019/10/13					<0.50	mg/L	NC	20

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

(1) Method blank exceeds acceptance limits for U- 2X RDL acceptable for low level metals determination.

VALIDATION SIGNATURE PAGE

The analytical data and all QC contained in this report were reviewed and validated by the following individual(s).

Ghayasuddin Khan, M.Sc., P.Chem., QP, Scientific Specialist, Inorganics

Rob Reinert, B.Sc., Scientific Spécialist

BV Labs has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per ISO/IEC 17025, signing the reports.
For Service Group specific validation please refer to the Validation Signature Page.

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

CERTIFICATE OF ANALYSIS

BV LABS JOB #: B995644

Received: 2019/11/04, 15:15

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) This test was performed by BV Labs Vancouver

(2) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).

Encryption Key

Please direct all questions regarding this Certificate of Analysis to your Project Manager.

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	17.3°C
-----------	--------

Sample WW4134, Elements by ICPMS Low Level (dissolved): Test repeated.

Results relate only to the items tested.

Site Location: KUDZ ZE KAVAH
Sampler Initials: BR

QC Batch	Parameter	Date	Matrix Spike		Spiked Blank		Method Blank		RPD	
			% Recovery	QC Limits	% Recovery	QC Limits	Value	UNITS	Value (%)	QC Limits
9660945	Total Vanadium (V)	2019/11/07	104	80 - 120	102	80 - 120	<0.00020	mg/L	1.0	20
9660945	Total Zinc (Zn)	2019/11/07	NC	80 - 120	106	80 - 120	<0.00010	mg/L	0.68	20
9660945	Total Zirconium (Zr)	2019/11/07	107	80 - 120	100	80 - 120	<0.00010	mg/L	NC	20
9664321	Dissolved Thallium (Tl)	2019/11/08	107	80 - 120	102	80 - 120	<0.0000020	mg/L	NC	20
9666703	Total Ammonia (N)	2019/11/12	104	80 - 120	101	80 - 120	<0.0050	mg/L	8.1	20

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

(1) Method blank exceeds acceptance limits for Sb- 2X RDL acceptable for low level metals determination.

Version: 1 - Final

CERTIFICATE OF ANALYSIS

BV LABS JOB #: B9A4160

Received: 2019/12/03, 14:48

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

- (1) This test was performed by BV Labs Vancouver
- (2) DOC present in the sample should be considered as non-purgeable DOC. Dissolved > Total Imbalance: When applicable, Dissolved and Total results were reviewed and data quality meets acceptable levels unless otherwise noted.
- (3) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).
- (4) TOC present in the sample should be considered as non-purgeable TOC.

Encryption Key

Please direct all questions regarding this Certificate of Analysis to your Project Manager.

=====

BV Labs has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per ISO/IEC 17025, signing the reports. For Service Group specific validation please refer to the Validation Signature Page.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

(1) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless

indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) This test was performed by BV Labs Calgary Environmental

(2) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	4.3°C
-----------	-------

Sample XD8567 [3A] : Sample analyzed for digested low level metals due to sediment in sample. This results in an increased reportable detection limit for Al B Ba Bi Cr Co Cu Fe Mn Ni P Pb Sb Si Ti U V and Zn.

Sample XD8568 [3B] : Sample analyzed for digested low level metals due to sediment in sample. This results in an increased reportable detection limit for Al B Ba Bi Cr Co Cu Fe Mn Ni P Pb Sb Si Ti U V and Zn.

Sample XD8569 [3C] : Sample analyzed for digested low level metals due to sediment in sample. This results in an increased reportable detection limit for Al B Ba Bi Cr Co Cu Fe Mn Ni P Pb Sb Si Ti U V and Zn.

Sample XD8570 [6A] : Sample analyzed for digested low level metals due to sediment in sample. This results in an increased reportable detection limit for Al B Ba Bi Cr Co Cu Fe Mn Ni P Pb Sb Si Ti U V and Zn.

Sample XD8571 [6B] : Sample analyzed for digested low level metals due to sediment in sample. This results in an increased reportable detection limit for Al B Ba Bi Cr Co Cu Fe Mn Ni P Pb Sb Si Ti U V and Zn.

Sample XD8572 [6C] : Sample analyzed for digested low level metals due to sediment in sample. This results in an increased reportable detection limit for Al B Ba Bi Cr Co Cu Fe Mn Ni P Pb Sb Si Ti U V and Zn.

Results relate only to the items tested.

QUALITY ASSURANCE REPORT(CONT'D)

ALEXCO ENVIRONMENTAL GROUP INC.
Client Project #: BMC-18-02
Site Location: KUDZ ZE KAVAH

QC Batch	Parameter	Date	Matrix Spike		Spiked Blank		Method Blank		RPD	
			% Recovery	QC Limits	% Recovery	QC Limits	Value	UNITS	Value (%)	QC Limits
9719066	Total Vanadium (V)	2019/12/24	99	80 - 120	100	80 - 120	<0.00020	mg/L	6.2	20
9719066	Total Zinc (Zn)	2019/12/24	92	80 - 120	99	80 - 120	<0.0010	mg/L	13	20
9719066	Total Zirconium (Zr)	2019/12/24	55 (1)	80 - 120	102	80 - 120	<0.00010	mg/L	0.20	20
9719983	Total Ammonia (N)	2019/12/24	92	80 - 120	91	80 - 120	<0.0050	mg/L	3.3	20

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference $\leq 2x$ RDL).

(1) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.

CERTIFICATE OF ANALYSIS

BV LABS JOB #: B9A7402

Received: 2019/12/13, 14:30

data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) This test was performed by BV Labs Vancouver

(2) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).

Encryption Key

Please direct all questions regarding this Certificate of Analysis to your Project Manager.

=====

BV Labs has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per ISO/IEC 17025, signing the reports. For Service Group specific validation please refer to the Validation Signature Page.

**RESULTS OF CHEMICAL ANALYSES OF WATER**

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

(1) Method blank exceeds acceptance limits for Mn- 2X RDL acceptable for low level metals determination.

(2) Method blank exceeds acceptance limits for U- 2X RDL acceptable for low level metals determination.

Report Date: 2019/12/23

ALEXCO ENVIRONMENTAL GROUP INC.
Client Project #: BMC-18-02
Site Location: KUDZ ZE KAYAH

VALIDATION SIGNATURE PAGE

The analytical data and all QC contained in this report were reviewed and validated by the following individual(s).

David Huang, M.Sc., P.Chem., QP, Scientific Services Manager

Harry (Peng) Liang, Senior Analyst

BV Labs has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per ISO/IEC 17025, signing the reports.
For Service Group specific validation please refer to the Validation Signature Page.

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope

CERTIFICATE OF ANALYSIS

BV LABS JOB #: C000859

Received: 2020/01/06, 13:13

dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) This test was performed by BV Labs Vancouver

(2) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).

Encryption Key

Please direct all questions regarding this Certificate of Analysis to your Project Manager.

QUALITY ASSURANCE REPORT(CONT'D)

ALEXCO ENVIRONMENTAL GROUP INC.
Client Project #: BMC-18-02
Site Location: KUDZ ZE KAVAH

QC Batch	Parameter	Date	Matrix Spike		Spiked Blank		Method Blank		RPD	
			% Recovery	QC Limits	% Recovery	QC Limits	Value	UNITS	Value (%)	QC Limits
9729833	Total Zirconium (Zr)	2020/01/09	104	80 - 120	99	80 - 120	<0.00010	mg/L	NC	20
Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.										
Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.										
Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.										
Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.										
NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)										
NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing.

CERTIFICATE OF ANALYSIS

BV LABS JOB #: C001231

Received: 2020/01/07, 10:41

BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) This test was performed by BV Labs Vancouver

(2) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).

Encryption Key

Please direct all questions regarding this Certificate of Analysis to your Project Manager.

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	10.7°C
-----------	--------

Sample XF1070 [4A] : Sample analyzed for digested low level metals due to sediment in sample. This results in an increased reportable detection limit for Al B Ba Bi Cr Co Cu Fe Mn Ni P Pb Sb Si Ti U V and Zn.

Sample XF1071 [4B] : Sample analyzed for digested low level metals due to sediment in sample. This results in an increased reportable detection limit for Al B Ba Bi Cr Co Cu Fe Mn Ni P Pb Sb Si Ti U V and Zn.

Sample XF1072 [4C] : Sample analyzed for digested low level metals due to sediment in sample. This results in an increased reportable detection limit for Al B Ba Bi Cr Co Cu Fe Mn Ni P Pb Sb Si Ti U V and Zn.

Results relate only to the items tested.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

(1) Method Blank exceeds acceptance limits for Ni - 2X RDL acceptable for low level metals determination.

(2) Method Blank exceeds acceptance limits for V - 2X RDL acceptable for low level metals determination.

(3) Method Blank exceeds acceptance limits for (Copper) - 2X RDL acceptable for low level metals determination.

(4) Method Blank exceeds acceptance limits for (Nickel) - 2X RDL acceptable for low level metals determination.

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope

dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) This test was performed by BV Labs Vancouver

(2) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).

BV Labs Job #: C001859
Report Date: 2020/01/16

QUALITY ASSURANCE REPORT(CONT'D)

ALEXCO ENVIRONMENTAL GROUP INC.
Client Project #: BMC-18-02
Site Location: KUDZ ZE KAVAH

QC Batch	Parameter	Date	Matrix Spike		Spiked Blank		Method Blank		RPD	
			% Recovery	QC Limits	% Recovery	QC Limits	Value	UNITS	Value (%)	QC Limits
9732713	Total Zirconium (Zr)	2020/01/14	109	80 - 120	100	80 - 120	<0.00010	mg/L	NC	20
Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.										
Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.										
Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.										
Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.										
NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)										
NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless

CERTIFICATE OF ANALYSIS

BV LABS JOB #: C002510

Received: 2020/01/13, 14:16

indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) This test was performed by BV Labs Calgary Environmental

(2) DOC present in the sample should be considered as non-purgeable DOC. Dissolved > Total Imbalance: When applicable, Dissolved and Total results were reviewed and data quality meets acceptable levels unless otherwise noted.

(3) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).

(4) TOC present in the sample should be considered as non-purgeable TOC.

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	19.3°C
Package 2	12.7°C
Package 3	18.3°C
Package 4	11.0°C

Results relate only to the items tested.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

(1) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.

(2) Method blank exceeds acceptance limits for U - 2X RDL acceptable for low level metals determination.

VALIDATION SIGNATURE PAGE

The analytical data and all QC contained in this report were reviewed and validated by the following individual(s).

David Huang, M.Sc., P.Chem., QP, Scientific Services Manager

Ghayasuddin Khan, M.Sc., P.Chem., QP, Scientific Specialist, Inorganics

Rob Reinert, B.Sc., Scientific Spécialist

BV Labs has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per ISO/IEC 17025, signing the reports. For Service Group specific validation please refer to the Validation Signature Page.

CERTIFICATE OF ANALYSIS

BV LABS JOB #: B9B0180

Received: 2019/12/27, 12:32

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) This test was performed by BV Labs Vancouver

(2) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	13.0°C
-----------	--------

Sample XE4037 [1C] : Sample analyzed for digested low level metals due to sediment in sample. This results in an increased reportable detection limit for Al B Ba Bi Cr Co Cu Fe Mn Ni P Pb Sb Si Ti U V and Zn.

Sample XE4038 [4A] : Sample analyzed for digested low level metals due to sediment in sample. This results in an increased reportable detection limit for Al B Ba Bi Cr Co Cu Fe Mn Ni P Pb Sb Si Ti U V and Zn.

Sample XE4039 [4B] : Sample analyzed for digested low level metals due to sediment in sample. This results in an increased reportable detection limit for Al B Ba Bi Cr Co Cu Fe Mn Ni P Pb Sb Si Ti U V and Zn.

Sample XE4040 [4C] : Sample analyzed for digested low level metals due to sediment in sample. This results in an increased reportable detection limit for Al B Ba Bi Cr Co Cu Fe Mn Ni P Pb Sb Si Ti U V and Zn.

Results relate only to the items tested.

Report Date: 2020/01/03

QUALITY ASSURANCE REPORT(CONT'D)

ALEXCO ENVIRONMENTAL GROUP INC.
Client Project #: BMC-18-02
Site Location: KUDZ ZE KAVAH

QC Batch	Parameter	Date	Matrix Spike		Spiked Blank		Method Blank		RPD	
			% Recovery	QC Limits	% Recovery	QC Limits	Value	UNITS	Value (%)	QC Limits

9723658	Total Ammonia (N)	2019/12/31	97	80 - 120	94	80 - 120	<0.0050	mg/L	9.6	20
---------	-------------------	------------	----	----------	----	----------	---------	------	-----	----

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

(1) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.

VALIDATION SIGNATURE PAGE

The analytical data and all QC contained in this report were reviewed and validated by the following individual(s).

Andy Lu, Ph.D., P.Chem., Scientific Specialist

Ghayasuddin Khan, M.Sc., P.Chem., QP, Scientific Specialist, Inorganics

Rob Reinert, B.Sc., Scientific Spécialist

BV Labs has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per ISO/IEC 17025, signing the reports. For Service Group specific validation please refer to the Validation Signature Page.

CERTIFICATE OF ANALYSIS – PARTIAL RESULTS

BV LABS JOB #: C002517

Received: 2020/01/13, 14:16

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) This test was performed by BV Labs Vancouver

N/A = Not Applicable

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

QC Standard: A sample of known concentration prepared by an external agency under stringent conditions. Used as an independent check of method accuracy.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

(1) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) This test was performed by BV Labs Calgary Environmental

(2) This test was performed by Sub Vancouver to ALS Burnaby

N/A = Not Applicable

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

QC Standard: A sample of known concentration prepared by an external agency under stringent conditions. Used as an independent check of method accuracy.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

(1) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.

CERTIFICATE OF ANALYSIS

BV LABS JOB #: C002517

Received: 2020/01/13, 14:16

Sample Matrix: Tissue (Plant)
Samples Received: 12

Analyses	Quantity	Date	Date	Laboratory Method	Analytical Method
		Extracted	Analyzed		
Elements in Tissue by CRC ICPMS - Dry Wt (1)	12	2020/01/22	2020/01/31	BBY7SOP-00021 / BBY7SOP-00002	EPA 6020b R2 m
Moisture in Tissue (1)	12	2020/01/17	2020/01/20	BBY8SOP-00017	BCMOE BCLM Dec2000 m

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) This test was performed by BV Labs Vancouver

(2) This test was performed by Sub Vancouver to ALS Burnaby

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	19.3°C
Package 2	12.7°C
Package 3	18.3°C
Package 4	11.0°C

Results relate only to the items tested.

QUALITY ASSURANCE REPORT(CONT'D)

ALEXCO ENVIRONMENTAL GROUP INC.
Client Project #: BMC-18-02
Site Location: KUDZ ZE KAVAH

QC Batch	Parameter	Date	Matrix Spike		Spiked Blank		Method Blank		RPD		QC Standard	
			% Recovery	QC Limits	% Recovery	QC Limits	Value	UNITS	Value (%)	QC Limits	% Recovery	QC Limits
9740454	Total (Dry Wt) Zinc (Zn)	2020/01/31	293 (1)	80 - 120	122 (2)	80 - 120	0.25, RD _L =0.20 (3)	mg/kg	3.0	40	102	75 - 125

N/A = Not Applicable

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

QC Standard: A sample of known concentration prepared by an external agency under stringent conditions. Used as an independent check of method accuracy.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference $\leq 2 \times \text{RD}_L$).

(1) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.

(2) Blank Spike outside acceptance criteria (10% of analytes failure allowed).

(3) Method Blank exceeds acceptance limits for Zn. Sample values for Zn are $>10 \times$ the concentration of the method blank and the contamination is considered irrelevant.

VALIDATION SIGNATURE PAGE

The analytical data and all QC contained in this report were reviewed and validated by the following individual(s).

Andy Lu, Ph.D., P.Chem., Scientific Specialist

Ghayasuddin Khan, M.Sc., P.Chem., QP, Scientific Specialist, Inorganics

Gita Pokhrel, Senior Analyst

Jennifer Villocero, Project Solutions Representative

Harry (Peng) Liang, Senior Analyst

BV Labs has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per ISO/IEC 17025, signing the reports. For Service Group specific validation please refer to the Validation Signature Page.

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.

Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.

This Certificate shall not be reproduced except in full, without the written approval of the laboratory.

Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) This test was performed by BV Labs Vancouver

(2) This test was performed by Sub Vancouver to ALS Burnaby

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	19.3°C
Package 2	12.7°C
Package 3	18.3°C
Package 4	11.0°C

Version 1 and Version 2 - Partial Reports Issued

Version 3 - Final Report - 2020/02/11

Version 4 - Revised report to included the Tessier Report (Job#C003223). 2020/02/13

Results relate only to the items tested.

N/A = Not Applicable

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

QC Standard: A sample of known concentration prepared by an external agency under stringent conditions. Used as an independent check of method accuracy.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference $\leq 2 \times \text{RD}_L$).

(1) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.

(2) Blank Spike outside acceptance criteria (10% of analytes failure allowed).

(3) Method Blank exceeds acceptance limits for Zn. Sample values for Zn are $>10 \times$ the concentration of the method blank and the contamination is considered irrelevant.

APPENDIX E: RECLAMATION AND CLOSURE COST ESTIMATE

(Provided Electronically as Excel File – Closure Cost Model)

APPENDIX F: TABLE OF CONCORDANCE

Reference No.	Proponent Commitment / Mitigation	Where addressed
YESAB R25	Risks associated with increased gully erosion of the Class A, B and C Waste Storage Facilities will be mitigated through the inclusion of benches to reduce the length of the overall slope. The benches will be sloped appropriately to minimize down slope flow, while the slopes will be contoured to minimize the potential for erosion. The upper terraces of the facilities will be graded to a slope of 2% to convey water at a reduced velocity and reduce ponding water. Concurrent reclamation and revegetation will minimize the areas susceptible to erosion during operations and the majority of the longer steeper slopes will be revegetated prior to the active closure phase. This design concept is commonly used for reducing the potential for gully erosion and has become accepted practise throughout the mining industry. If gully erosion is observed in areas on the storage facilities it will be remedied by a combination of some or all of: armoring, backfilling, recontouring, and revegetation.	See section 7.4 of the Reclamation and Closure Plan
YESAB R26	On-going Project development and detailed design will include refinement of the closure plan for the facilities, including shaping and/or re-sizing of the upper terraces to mimic pre-mining conditions and natural landforms.	See Chapter 5 and Section 7.4 of the Reclamation and Closure Plan
YESAB R28	The proposed landforms for the waste facilities are not final. As the design level for these facilities advances through subsequent regulatory phases, landform design details will advance in a commensurate fashion, consistent with the 'design for closure' philosophy that underpins all planning for the Project.	See Chapter 5 and Section 7.4 of the Reclamation and Closure Plan
YESAB R32	"How will interflow waters be managed to prevent excessive build-up of pore-water pressures within the cover system in the lower slope regions and limit the potential for shallow instability of cover layers above the reduced permeability layers?" This is an important design consideration, and the detailed design process will ensure that the rock used is sized, graded, and sloped appropriately, and placed so as to be stable. The planned drainage diversions around the waste facilities will reduce upslope run-on waters contributing to this potential, and the proposed slopes of the facilities and covers will further reduce this potential. Design and operational management practices will further address this consideration as facility cover design proceeds.	See Section 7.4 of the Reclamation and Closure Plan
YESAB R33	"How will higher or lower evapotranspiration rates from the 30 % estimate affect seepage rates from the base of the waste storage facilities and what are the implications to stability and water management?" This is an important design consideration that is addressed through the landform design of the facility, and water management structures. Less evapotranspiration would be associated with increased surface runoff, not necessarily increased seepage from the foundation of the facility. This will additionally be addressed through future detailed design studies and ongoing reclamation research during operations to determine the compaction and thickness of the lower permeability and frost protection layers, such that saturated flow conditions are not developed at the base of the Class B Storage Facility. Saturated conditions will not develop at the base of the Class A Storage Facility as the very low permeability layer will prevent sufficient seepage from creating these conditions.	Feasibility level designs (see Section 7.4), Reclamation research (see Section 2.5.1) and Monitoring (see Section 7.11)
YESAB R34	As part of final engineering design, the time required to achieve the final settled density will be estimated. This is the period in which more frequent inspections and maintenance would be expected. It is not unusual for a cover design to account for erosion, and still maintain the integrity of the cover to achieve the designed outcomes. There is always the potential for an extreme event that may necessitate a major repair or partial replacement. The triggers for requiring maintenance will be determined during the detailed design phase. The trigger for replacing all or a portion of the cover would be determined during the advancement of the Adaptive Management Plan. Overall the design, operating methodology and method of compaction will be signed off by the design engineers prior to final granting of the QML.	Section 2.5.1 of the Reclamation and Closure Plan

Reference No.	Proponent Commitment / Mitigation	Where addressed
YESAB R35	Should a geosynthetic liner be selected as the very low permeability layer for the Class A Storage Facility, the triggers for major maintenance or repair will be determined during the detailed design phase. The service life of geosynthetic liners is highly dependent on site-specific conditions, with short term failures most commonly being a result of punctures or stresses during construction. Depending on the material of the liner and the exposure conditions the expected lifetime can range from decades to centuries.	Section 7.11 of the Reclamation and Closure Plan
YESAB R35	The Failure Modes Effects Analysis process will refine the Closure Plan elements, such as advancing the cover designs, as well as defining mitigation measures and alternatives.	See Appendix A (Failure Modes and Effects Assessment) of the Reclamation and Closure Plan
YESAB R36	The final design of the cover systems will include a monitoring and maintenance plan to ensure these objectives are met and to identify if the cover is performing as designed. If the design underperforms, additional measures will be required to reduce the environmental loading to those proposed in the conceptual design.	Section 7.11 of the Reclamation and Closure Plan
YESAB R36	The potential exists for an extreme event that would affect the cover system that may necessitate a major repair or partial replacement. The triggers for requiring maintenance will be determined during the detailed design phase. The trigger for replacing all or a portion of the cover would be determined during the advancement of the Adaptive Management Plan.	Section 7.11 of the Reclamation and Closure Plan
YESAB R107	A phased approach will be used for the design, construction and operation of the constructed wetland treatment system.	See Section 2.5.4 of the Reclamation and Closure Plan
YESAB R108	Project specific treatment rate coefficients will be further refined during future pilot-scale and/or demonstration-scale testing.	See Appendix D of the Reclamation and Closure Plan (Off Site Constructed Wetland Treatment System Pilot)
YESAB R109	As part of the site-specific CWTS design process, aspects that would facilitate continued treatment throughout cold-climate or freezing conditions are thoroughly assessed. Phase 3 of the CWTS design (off-site pilot-scale testing) incorporates freezing trials to inform on the effect that cold weather would have on treatment.	See Appendix D of the Reclamation and Closure Plan (Off Site Constructed Wetland Treatment System Pilot)
YESAB R109	The CWTS implementation timeline outlined in the response to R107 includes contingencies in the form of additional time to reassess and reconfigure the CWTS design should any unanticipated water chemistry conditions arise.	See Appendix D of the Reclamation and Closure Plan (Pilot-Scale CWTS)
YESAB R125	The design detail for the CWTS installations and infrastructure will be appropriately advanced with further development of site facility designs and with the collection of additional water quality information. This will be provided in applications to support the regulatory permitting process.	See Appendix D of the Reclamation and Closure Plan (Pilot-Scale CWTS)
YESAB R278	Given the Project focus on designing for closure, the FMEA process has been identified in the Conceptual Closure and Reclamation Plan (Section 7.12.1, February 2017, Appendix H of the Project Proposal), and BMC is committed to utilizing the Reclamation and Closure Planning tool to advance the design and closure measure aspects of the waste management facilities. This will be undertaken to support the advancement and refinement of the facility design, and will be a component of the more detailed Reclamation and Closure Plan that will be developed in accordance with YG's 2013 Guidance Document: Reclamation and Closure Planning for Quartz Mining Projects guide by Yukon Government and the Yukon Water Board.	The Reclamation and Closure Plan and the designs that have progressed since the environmental assessment have taken into account the FMEA (Appendix A)
YESAB R280	Detailed closure costing, following the 2013 guidance document, will be submitted in support of permit applications and for the determination of security in accordance with YG's Mine Closure Policy.	See Chapter 9 and Appendix E (Closure Cost Estimate) of the Reclamation and Closure Plan
YESAB R2-3	The FMEA for the Class A Storage Facility and the Risk Register were prepared at the request of YESAB, and will be updated and refined during the detailed Project design/planning including during the development of the detailed reclamation and closure plan (as described in response to R278, above).	See Appendix A (Failure Modes and Effects Assessment) of the Reclamation and Closure Plan

Reference No.	Proponent Commitment / Mitigation	Where addressed
YESAB R2-9	The upper terrace of the Class A Storage Facility will be sloped at 2% towards the lower reclaimed slopes. The final surface will be shaped to direct runoff to multiple designed channels to safely convey surface runoff over the reclaimed facility and buttress. The surface runoff collection channels will be constructed during the mine life as the facility is progressively reclaimed.	See Chapter 5 and Section 7.4 of the Reclamation and Closure Plan
YESAB R2-10	The Class A Storage Facility will be constructed at an overall slope of 4H:1V, and will be progressively reclaimed with a low permeability cover, followed by approximately five meters of Class C waste rock material for frost protection and long-term stability. Topsoil and material from the overburden stockpile will be placed on the frost protection layer, and this will then be revegetated to mimic the current site conditions. Gullies that may develop due to erosion will be limited to the depth of the topsoil layer and are unlikely to erode through the five-metre thick frost protection waste rock layer. Benches will be added to the Class A and Class B facilities as an erosion mitigation measure. The benches will not include lateral drainage channels; rather the benches will be constructed to maintain a grade sloping towards the lower elevations and rely on gravity drainage, thereby eliminating the potential of ponding water on the benches. The Class B Storage Facility will be constructed at an overall slope of 3H:1V for long-term physical stability and to allow for re-contouring if required for reclamation and closure. Note that the recontouring will include benches with berms/ditches to control runoff. The benches will be similar to the existing natural slope of the area. The Class B Storage Facility will be progressively covered and reclaimed. A layer of topsoil and overburden material will be placed above a layer of Class C waste rock (providing frost protection). These layers overlie a low permeability layer to minimize infiltration of precipitation into the Class B Storage Facility, and any gullies that may develop due to erosion will be limited to the depth of the topsoil layer. The frost protection layer constructed of Class C waste rock will also mitigate potential erosion. The Class C Storage Facility is composed of potentially acid consuming waste rock and will have no infiltration restricting cover. The facility will have final overall face slopes of 3H: 1V while the top of the facility will have an overall flat gradient. The final facility bench crests will be rounded and the faces sloped to improve the long-term erosion stability of the facility. The recontouring will include benches with berms/ditches, constructed similar to the existing natural slope of the area, to control runoff. The placed waste rock will be compacted and a cap of growth medium will be placed on the facility and revegetation will take place up to a pre-determined elevation. The top of the facility will mimic a large flat valley and will be contoured to blend with the surrounding topography. Any gullies that may develop due to erosion will be limited to the depth of the topsoil layer, due to the Class C material below being resistant to erosion and this material will similarly allow precipitation to infiltrate and drain away rather than flow across the surface of the facility.	See Chapter 5 and Section 7.4 of the Reclamation and Closure Plan

Reference No.	Proponent Commitment / Mitigation	Where addressed
YESAB R2-14	The Project Closure Plan is conceptual at this stage and will be further developed and finalized during permitting in consultation with EMR, Yukon Water Board, and RRDC. Independent of the details of the cover design, the following 'tools' have been identified for long term monitoring of cover system performance: • Lysimeters – to monitor seepage (if any) through the covers; • Physical inspections (looking for unusual occurrences, such as settlement or sloughing, abnormal seepage from any area on the slopes, isolated pockets of vegetation stress, and physical damage); and • Downgradient surface and groundwater quality stations. Water quality monitoring will occur downgradient of the facilities, which will be subject to a statistical review to monitor for any potential warning signs to determine if there is a problem with the cover. Additionally, there will be an Adaptive Management Plan (AMP), which will identify specific thresholds from the monitoring and inspection program. These thresholds are staged as early warning indicators, to increase monitoring and implement mitigative actions ranging from statistical analysis of monitoring, installation of instrumentation, maintenance activities, to review of the design performance by the engineer.	See Section 7.11 of the Reclamation and Closure Plan
YESAB R2-14	Inspections will be performed annually until the cover systems have been shown to have stabilized, which will be determined by the design engineers. Inspections will guide regular maintenance to ensure the cover systems are operating effectively. If it is indicated through inspections and monitoring that the cover is not meeting design objectives, alternatives will be assessed through the AMP. The Class A and B Facilities will have very low permeability liner cover systems, which will significantly reduce the seepage through each facility. However, one of the alternatives available, if the cover is not sufficiently reducing seepage as per the design basis, is to convert the collection ponds to bioreactors to treat the excess seepage.	See Section 7.11 of the Reclamation and Closure Plan for monitoring and See Section 2.5.4 for commitment to applying contingency measures.
YESAB R2-15	The Project Closure Plan outlined at this stage will be further developed and if required, optimized during the detailed engineering phase of the Project design and as part of final permitting in consultation with EMR, Yukon Water Board, and RRDC. Some of the performance measures that may be selected are: • Quality control measures during installation, such as inspecting seams after they have been welded, following specifications for drainage and bedding layers; • Monitoring of seepage quality and quantity into the collection ponds, as the facility is progressively reclaimed; • Field inspections looking for settling, sloughing, seeps, and erosion; and • Instrumentation and lysimeters will be installed during progressive reclamation within and under the cover system to monitor moisture, frost depths, and pressure.	See Section 7.11 of the Reclamation and Closure Plan

Reference No.	Proponent Commitment / Mitigation	Where addressed
YESAB R2-17a	Phases 1b, 2 and 3 of the Constructed Wetland Treatment System Schedule and Execution Strategy will be undertaken in 2018 and 2019 using the updated model predictions that will be submitted during Water Licencing (i.e. pre-operational period). That being said, BMC has conducted an optimization assessment of the closure plan (including revised water quality modelling) to ensure receiving environment water quality meets the water quality objectives without the reliance on the proposed wetlands. This assessment confirms that the wetlands will function only to further improve water quality or “polishing” and is not needed nor is it intended to be the primary treatment mechanism.	See Section 2.5.4 of the Reclamation and Closure Plan
YESAB R2-17b	The RCP submitted during permitting will include alternative closure approaches for the Kudz Ze Kayah site, demonstrating long-term chemical and physical stability, as an alternative to CWTS.	Section 2.4 of the Reclamation and Closure Plan presents the closure alternatives that have been evaluated for the Project. Throughout the Environmental Assessment Process the designs were refined and the CWTS became the contingency measure if the objectives of the ABM lake treatment are not met (see Section 2.5.4 of the Reclamation and Closure Plan)
YESAB R2-17c	Closure costs will be further refined in accordance with the continual review and revision of the Plan required by the Quartz Mining Licence.	See Chapter 9 and Appendix E (Closure Cost Estimate) of the Reclamation and Closure Plan
YESAB R2-29	There will be no active pumping in perpetuity after closure of the site per Yukon Government’s Mine Closure Policy. All drainage and treatment will be passive.	No long term active pumping is proposed in the Reclamation and Closure Plan
YESAB R4-2	Soils at the site will be managed through all Project Phases to ensure that it does not have the potential to prevent the traditional land users from using the area in the post closure period.	Section 7.11 of the Reclamation and Closure Plan
YESAB R4-2	There will be no contamination of the land that will prevent the land users from returning to the KZK project area in post closure.	See Section 7.11 of the Reclamation and Closure Plan
YESAB R4-2	Vegetation at the site will be managed through all Project phases to ensure that it does not have the potential to prevent the traditional land users from using the area for harvesting vegetation in the post closure period.	See Sections 2.5.2, 7.1.2, and 7.11.3 of the Reclamation and Closure Plan
YESAB R4-2	Through the Project design; mitigation measures; monitoring programs; adaptive management; and the development of the final reclamation and closure plan, the LFN traditional land users should be able to resume harvesting vegetation from the Project area in the post closure period. It is anticipated that any additional land use information related to culturally important plants at KZK, that is made available by LFN in the future, will be incorporated into BMC’s management and operating plans at that time.	See Section 2.3.2 of the Reclamation and Closure Plan
YESAB R4-4	During the post closure phase all areas including the Project area will again be available and safe for use by the traditional land users.	The plan in its entirety provides details with respect to ensuring chemical stability of the site in the Closure and Post-closure phases of the Project
YESAB R4-4	Because the spills and all associated affected soils will be cleaned up, there is no potential for such spills to affect the land users in the post closure period. The quality of country foods (specifically vegetation and wildlife) are related (in part) to the quality of soil in the environment that they live. Because spills and all associated affected soils will be cleaned up, there is no potential for these foods to become impacted from exposure to a spill during construction, operations and active and transition closure.	See Section 7.8 of the Reclamation and Closure Plan

Reference No.	Proponent Commitment / Mitigation	Where addressed
YESAB R4-4	BMC has proposed a BMC-Kaska Environmental, Cultural & Heritage Management Program for KZK. Through this co-management program it is anticipated that RRDC will collaboratively design, collect, report, manage and communicate the results of the air and soil quality monitoring programs to RRDC citizens (including the RRDC Elders Oversight Committee). This program would be active through all Project phases and would collaboratively ensure that the soil concentrations during all Project phases are not at levels that could potentially effect the quality of country foods. It would also collaboratively ensure that concentrations in the soils at closure are at levels which the traditional land users can safely use the land in the Geona Creek valley for traditional land use purposes. Through this co-management program, the risk of the traditional land users of avoiding the Project area will be reduced.	See Section 2.3.1 and Section 7.11.5 of the Reclamation and Closure Plan
YESAB R4-4	In the closure period, the only potential sources of COPs in vegetation from water sources will be the constructed wetlands. The water management program will control and treat any contact water prior to release to the environment during operations and closure. A soil and vegetation metal monitoring program will commence with installation of constructed wetlands to monitor the efficacy of the constructed wetland at treating water as well as to ensure that metals are not accumulating to any significant degree in the wetlands. For wetlands, soils will also be tested for nutrients, metals, and microbes. The wetlands are designed to create metal compounds in the soil and root systems that are not bioavailable. The monitoring program will be used to ensure that metals are not accumulating significantly in the vegetative matter as planned and expected. If there is significant increase in vegetation metal concentrations beyond background, then the wetland system will be modified to minimize wildlife access.	See Section 7.11 of the Reclamation and Closure Plan
YESAB R4-4	Terrestrial vegetation on Project facilities during the closure period will not be affected due to the thickness of the covers between the vegetation and waste rock/tailings.	See Section 7.11 of the Reclamation and Closure Plan
YESAB R4-4	The reclamation research program was initiated in 2017 (which will become a component of the Kaska Co-management program) will be ongoing through all Project phases. The program will ensure that the vegetation used in reclamation is culturally appropriate and/or is approved by RRDC. Through this co-management program, the risk of the traditional land users of avoiding the Project area (post reclamation) will be reduced.	See Section 2.5.2 of the Reclamation and Closure Plan and Appendix B of the Reclamation and Closure Plan (Revegetation Trial Study)
YESAB R4-4	The importance of reclaiming the Geona Creek system to its current state was described to BMC during a meeting with the RRDC Elders Committee in April of 2017. In this meeting the Elders indicated that they would not support a project that proposed slurry tailings due to water quality concerns. BMC subsequently re-assured the Elders that BMC had conducted an assessment of tailings disposal methods and that the filtered tailings method had been designed for the Project rather than slurry tailings in Geona Creek. It was also re-iterated that the closure plan (as proposed) will ensure that traditional land use activities can resume post closure.	See Sections 2.3.2 and 2.4.1 of the Reclamation and Closure Plan
YESAB R4-4	BMC's proposed reclamation plan to: "Return the mine site and affected areas to viable and, wherever practicable, self-sustaining ecosystems that are compatible with a healthy environment and with traditional land use activities" is presented in Appendix H of the Project Proposal. The implementation of the Reclamation and Closure Plan will ensure that the displaced animals return to the Project area such that the traditional activity of hunting/trapping can be resumed.	See Section 7.11 of the Reclamation and Closure Plan
RRDC Adequacy Review R-10	BMC commits to restoring the mined area after closure to a natural, thriving biodiverse environment which includes ensuring the quality of water. Continual water monitoring will provide assurance of the effectiveness of all mitigation and remedial measures.	See Section 7.11 of the Reclamation and Closure Plan
RRDC Adequacy Review R-10	In addition to aquatic ecosystem protection, the Health Canada drinking water guidelines will be met in the receiving environment for all parameters.	See Section 7.11.2 of the Reclamation and Closure Plan

Reference No.	Proponent Commitment / Mitigation	Where addressed
RRDC Adequacy Review R-11	In situ treatment of the resulting ABM lake is proposed as a mitigation measure which will lower COPI concentrations (including uranium and arsenic) such that no long term effects to downstream water quality downstream are expected. The in situ treatment proposed will involve the addition of soluble organic carbon (such as molasses and/or alcohol) to stimulate native microorganisms in ABM lake, which will produce conditions under which COPIs will precipitate, therefore lowering their concentrations. If acidic conditions start to develop as the ABM pit fills (but before it discharges downstream), lime will also be added to return the ABM lake pH to circumneutral conditions.	See Section 7.2 of the Reclamation and Closure Plan
RRDC Adequacy Review R-11	The COPI concentrations in ABM lake will be monitored as part of the closure Monitoring, Surveillance, and Adaptive Management Plan, which will be developed in partnership with RRDC. Water quality triggers, informed by the water quality modelling, will be described in the plan which will prompt adaptive management measures such as additional treatment of ABM lake to ensure downstream water quality is maintained.	RRDC/Dena Cho reviewed and contributed to all management plans prior to them being finalized and submitted to EMR See Sections 7.2.1 and 7.11.2 of the Reclamation and Closure Plan
RRDC Adequacy Review R-11	The Monitoring, Surveillance, and Adaptive Management Plan, for closure will describe the monitoring and surveillance associated with the constructed wetland treatment systems (CWTS). It will also outline responses to be implemented if unacceptable conditions are observed in these monitoring programs (i.e. adaptive management).	The detailed Monitoring, Surveillance, and Adaptive Management Plan for the CWTS will be added to the Closure Plan once the detailed designs of the CWTS has been further progressed (i.e. sizing, exact location etc.)
RRDC Adequacy Review R-11	Regular sampling of the waters entering and leaving the CWTS will occur during post-closure to ensure the CWTS is functioning as expected. Regular monitoring will also indicate any required maintenance of the constructed wetland treatment systems to ensure it continues to adequately treat the influent waters. These requirements will be further developed and become more detailed as the CWTS design advances and as the proposed Project facility is constructed and commissioned, but could include: • Removal of debris and/or undesirable vegetation (i.e. willows, alder) that is blocking treatment or bypass channels, or is destabilizing embankments; • Removal of excess sedimentation to reduce channelization; and/or • Remedial activities related to liners/berm.	The detailed Monitoring, Surveillance, and Adaptive Management Plan for the CWTS will be added to the Closure Plan once the detailed designs of the CWTS has been further progressed (i.e. sizing, exact location etc.)
RRDC Adequacy Review R-13	Once mining operations are completed, BMC are committed to returning the land to viable and self-sustaining ecosystems that are compatible with a healthy environment and with traditional land use activities.	See Section 2.2 of the Reclamation and Closure Plan
RRDC Adequacy Review R-13	Soil amendments will be made to promote revegetation using baseline data and results from reclamation research. Additional detail on amendments will be provided in the final detailed Reclamation and Closure Plan that will be developed and submitted for approval during licensing prior to construction. Reclamation research results will subsequently be used for any updates to the soil amendment prescriptions and updates to the Reclamation and Closure Plan.	See Section 2.5.2 of the Reclamation and Closure Plan and Appendix B of the Reclamation and Closure Plan (Revegetation Trial Study)
RRDC Adequacy Review R-13	Continuous progressive reclamation techniques including progressive stripping and replacement are expected to partially offset the potential deconditioning of stripped soils, as the entire area is not stripped prior to mine operations.	Numerous sections of the Reclamation and Closure Plan commit BMC to conducting progressive reclamation
RRDC Adequacy Review R-13	On site research will help develop suitable strategies to re-establish the native soil structure and promote revegetation.	See Section 2.5.2 of the Reclamation and Closure Plan and Appendix B of the Reclamation and Closure Plan (Revegetation Trial Study)

Reference No.	Proponent Commitment / Mitigation	Where addressed
RRDC Adequacy Review R-14	Continuous progressive reclamation techniques are expected to partially offset the potential deconditioning of stripped soils, as the entire area is not stripped prior to mine operations. The following measures will be taken to retain nutrients in soils: • Topsoil will be immediately reused and placed on reclaimed areas as it is stripped (if reclaimed areas are available at the time of stripping), so as to maintain soil structure and viability; • If soil is stockpiled, it will be kept in low berms; and • Vegetation will be either stripped with (or prior to) the topsoil stripping and placed on final reclaimed areas, with or on top of the topsoil so that decomposition helps maintain soil nutrients and structure. Reclamation of the mine site is proposed as a progressive function of mine development, returning the natural environment to a pre-mining state as quickly as practicable to maintain soil structure and nutrients. BMC recognize that soil and seed viability are essential for revegetation success and propose working closely with RRDC in development of Environmental Management Plans that would include seed collection, seedling propagation, and seeding and seedling planting as part of reclamation activities to restore the KZK Project site.	See Section 2.4.4 and Section 2.5.2 of the Reclamation and Closure Plan
RRDC Adequacy Review R-15b and 16	The wetlands created along the pond edges as part of the Fisheries Offset Plan, the constructed wetland treatment system, and reclamation of water management ponds will initially not be natural wetlands, but will be designed and planted with native species to optimize water treatment for the constructed wetlands and to maximize biodiversity for the fish pond creation and the reclamation of other water management ponds. Studies have shown that biodiversity can be high in constructed and reclaimed wetlands at mine sites (Howie, 2006 and Lacki et al, 2004), and for these reasons, the reclaimed wetlands will be functionally similar (meaning the wetland will support similar wildlife populations).	See Section 7.11 of the Reclamation and Closure Plan
RRDC Screening Review (Surface Water)	The proposed wetlands are now considered to be a contingency measure (rather than relying on the efficacy of the wetlands to meet the WQOs in Post-Closure). Although the wetlands are now considered a contingency measure, BMC will undertake a comprehensive program to design, test, optimize, implement and maintain constructed wetlands in a site-specific manner the constructed wetlands for the Post-Closure phase.	See Section 2.5.4 of the Reclamation and Closure Plan and Appendix D of the Reclamation and Closure Plan (Off Site Constructed Wetland Treatment System Pilot)
RRDC Screening Review (Surface Water)	The stability of the precipitates generated during constructed wetland treatment will be monitored as part of the ongoing test work and once the CWTS is constructed and operated during the closure phase.	See Appendix D of the Reclamation and Closure Plan (Off Site Constructed Wetland Treatment System Pilot) and Section 7.11.3 of the Reclamation and Closure Plan
RRDC Screening Review (Surface Water)	Plants selected for the CWTS will be those that are not known to uptake large amounts of metals. This will be confirmed through the laboratory analysis of plants and moss to be conducted at the end of the pilot-scale tests, on-site test and once the CWTS is constructed and operated during the closure phase.	See Appendix D of the Reclamation and Closure Plan (Off Site Constructed Wetland Treatment System Pilot) and Section 7.11.3 of the Reclamation and Closure Plan
RRDC Screening Review (Surface Water)	Freeze-thaw tests and stagnation tests will be performed to confirm that there will be no release of metals under changing environmental conditions.	See Appendix D of the Reclamation and Closure Plan (Off Site Constructed Wetland Treatment System Pilot)

Reference No.	Proponent Commitment / Mitigation	Where addressed
RRDC Screening Review (Surface Water)	Freeze-thaw tests will mimic winter and spring thaw effects on the pilot system and to evaluate the benefit of additional sorption of metals by moss and AVS production to evaluate the robustness of the system during winter.	See Appendix D of the Reclamation and Closure Plan (Off Site Constructed Wetland Treatment System Pilot)
RRDC Screening Review (Surface Water)	All wildlife activity is discouraged in the constructed wetland, as typically the water entering the wetlands is still in the process of being treated, and wildlife may disturb the wetland and impact its efficacy. Wildlife may also disturb the wetland and impact its efficacy. The wetland is a secondary polishing step and the water entering the wetland is predicted to be safe for wildlife, due to initial treatment through the water treatment plant; wildlife activity will still be discouraged through the use of the following design features: uniform water depth (difficult to navigate by wildlife), plant monocultures (unappealing to wildlife), no open water (unappealing to waterfowl), and steep embankments armoured with riprap (difficult to access). These features also improve the performance of the treatment wetland.	The Implementation Plan as well as the Monitoring, Surveillance, and Adaptive Management Plan for the CWTS will be added to the Closure Plan once the detailed designs of the CWTS has been further progressed (i.e. sizing, exact location etc.). The implementation plan will include methods for discouraging wildlife to enter the CWTS
RRDC Screening Review (Surface Water)	The water treatment plant will remain in place during the Active and Transition Closure Phases and will not be decommissioned until the CWTS has been demonstrated in the field. This contingency measure will ensure that downstream water quality is not adversely affected during the implementation of the closure mitigation plans.	See Section 7.7 of the Reclamation and Closure Plan
RRDC Screening Review (Surface Water)	The water treatment plant will remain in place during the Active and Transition Closure Phases and will not be decommissioned until in situ treatment has been demonstrated in the field. This contingency measure will ensure that downstream water quality is not adversely affected during the implementation of the Closure mitigation plans.	See Section 7.7 of the Reclamation and Closure Plan
RRDC Screening Review (Fish and Wildlife)	BMC will be developing the adaptive management plans that will be submitted to the Waterboard and EMR as part of the Water Use Licence and Quartz Mining License Applications. This will include management strategies to reduce the effects from a reduction of flows and water levels in the receiving environment of South Lakes once Fault Creek is diverted back to its original path in the Active Closure phase BMC has committed to working with Dena Cho in the development of this and other management plans through the existing contractual agreements between the parties.	RRDC/Dena Cho reviewed and contributed to all management plans prior to them being finalized and submitted to EMR See Table 2-1 Section 7.11.2 of the Reclamation and Closure Plan
BMC Response to Public Comments on the DSR	The overall approach and modelling used to predict water quality in the ABM Pit at closure will be refined through the permitting processes and through various Project phases to provide “proof of concept prior to final closure”. Although there is no specific condition in the Draft Screening Report for additional studies or models, in 2018 BMC initiated pilot-scale test work to evaluate the dosage of organic carbon (molasses and glycerol), nitrogen, and phosphorus, and the effects of soil amendment and temperatures on the efficacy of the proposed in situ treatment. The results of this test work and the commitment for ongoing reclamation research will be a component of the Water Licence and Quartz Mining Licence applications. Note that this level of detail is required in the licence applications, based on Water Board guidance (Yukon Water Board, 2012) and guidance from Yukon Government’s Department of Energy, Mines and Resources (Yukon Energy, Mines and Resources, 2013). Further, the results of the ongoing studies will implicitly be considered in the final engineering design (which may be different than the conceptual design of adding “lime and carbon”) as the final design will need to achieve the water quality objectives in the receiving environment.	See Section 2.5.3 of the Reclamation and Closure Plan and Appendix C (ABM Pit Lake Treatment Study) of the Reclamation and Closure Plan
BMC Response to LFN Comments on DSR	The water treatment plant will remain on site during the closure phases as a contingency measure.	See Section 7.7 of the Reclamation and Closure Plan
BMC Response to LFN Comments on DSR	A Constructed Wetland Treatment System (CWTS) will be the contingency measure in the event that the ABM Lake treatments are not as efficient as predicted.	See Section 2.5.4 of the Reclamation and Closure Plan

Reference No.	Proponent Commitment / Mitigation	Where addressed
BMC Response to LFN Comments on DSR	Additional confirmatory test work for the in situ ABM Lake treatments and constructed wetland treatment system(s) is underway and the results of this test work will be included as part of BMC's applications for a Type A Water Licence and Quartz Mining Licence.	See Appendix C (ABM Pit Lake Treatment Study) and Appendix D (Off Site Constructed Wetland Treatment System Pilot) of the Reclamation and Closure Plan
BMC Response to LFN Comments on DSR	BMC will continue to reach out to LFN to seek meetings with LFN's consultants to correct any misinterpretations with respect to the predicted water quality in closure and proposed contingency measures.	See Section 2.3.2 of the Reclamation and Closure Plan
BMC Response to LFN Comments on DSR	BMC remains committed to ongoing engagement with all parties interested in the Project, including LFN.	See Section 2.3 of the Reclamation and Closure Plan
BMC Response to LFN Comments on DSR	The off-site bench scale testing and optimization phase has been conducted and the results of this research will be submitted to the Yukon Water Board during licensing.	See Appendix C of the Reclamation and Closure Plan (ABM Pit Lake Treatment Study)
BMC Response to LFN Comments on the DSR	Off-site pilot-scale testing of the CWTS and in situ treatment has been undertaken and will form part of the WL application.	See Appendix C (ABM Pit Lake Treatment Study)
BMC Response to LFN Comments on the DSR	The overall approach and modelling used to predict water quality in the ABM pit at closure will be refined through the permitting processes and through various Project phases to provide "proof of concept prior to final closure".	See Appendix D of the Reclamation and Closure Plan (Off Site Constructed Wetland Treatment System Pilot)
BMC Response to LFN Comments on the DSR	The results of this test work and the commitment for ongoing reclamation research will be a component of the Water Licence and Quartz Mining Licence applications and conditions.	See Section 2.5 of the Reclamation and Closure Plan
BMC Response to LFN Comments on the DSR	It is anticipated that a demonstration-scale CWTS (Phase 4) will be undertaken at the Site during the Operations phase of the Project, while the full-scale CWTS (Phase 5 – the final stage) will be installed and commissioned during Transition Closure phase as the ABM pit fills.	See Section 2.5.4 of the Reclamation and Closure Plan
BMC Response to LFN Comments on the DSR	BMC's Reclamation and Closure Plan Goal is: "To return the mine site and affected areas to viable and, wherever practicable, self-sustaining ecosystems that are compatible with a healthy environment and with traditional land use activities." Although this goal is achievable, it doesn't preclude traditional land users from choosing not to use the land base due to perceived risks. BMC looks forward to working with LFN and RRDC Chiefs and Councils to educate about residual risks so that any potential future decision on land use by individuals is made with all the facts at hand.	See Section 2.3.2 of the Reclamation and Closure Plan
Project Proposal Chapter 6 (BMC, 2017a)	Re-vegetate waste rock storage areas final surfaces early where practicable.	See Sections 2.4.4, 2.5.1, 5.2.1.1 and 5.2.1.2 of the Reclamation and Closure Plan
Project Proposal Chapter 8 (BMC, 2017a) and BMC Response on Draft Screening Report (BMC, 2020)	Construction of Water Treatment Plant which will remain on site until the closure objectives are met in the receiving environment.	Section 7.7.2.5 of Reclamation and Closure Plan
Project Proposal Chapter 8 (BMC, 2017a)	ABM lake treatment with lime and carbon source as it fills (as required).	Sections 7.1 and 7.2 of Reclamation and Closure Plan
Project Proposal Chapter 8 (BMC, 2017a)	Constructed wetland treatment system at closure.	Section 2.5.4 and 7 of Reclamation and Closure Plan

Reference No.	Proponent Commitment / Mitigation	Where addressed
Project Proposal Chapter 9 (BMC, 2017a)	Re-divert Fault Creek into Geona Creek watershed and the ABM lake to accelerate the filling of the ABM open pit during Closure.	Section 7.2 of Reclamation and Closure Plan
Project Proposal Chapter 11 (BMC, 2017a)	Reclamation methods that reduce equipment traffic during soil redistribution and placement will be utilized to lessen compaction of soil in stockpiles and reclaimed areas. For example, where practicable, instead of a dozer, a backhoe will be used to distribute topsoil cover in the reclaimed areas. Ripping will be used in areas where surficial soils are excessively compacted.	Section 7.1.1 of Reclamation and Closure Plan
Project Proposal Chapter 11 (BMC, 2017a)	During salvage operations, mitigation against soil degradation by having multiple topsoil storage areas, will focus on minimizing the number of times the soil is moved, reducing vehicle traffic over the stockpile surface, and avoiding handling soils when they are too dry or too wet.	Section 7.1.2 of Reclamation and Closure Plan
Response Report #1 (BMC, 2017a) (BMC, 2017b)	Risks associated with increased gully erosion of the Class A, B and C Waste Storage Facilities will be mitigated through the inclusion of benches to reduce the length of the overall slope. The benches will be sloped appropriately to minimize down slope flow, while the slopes will be contoured to minimize the potential for erosion. The upper terraces of the facilities will be graded to a slope of 2% to convey water at a reduced velocity and reduce ponding water. Concurrent reclamation and revegetation will minimize the areas susceptible to erosion during operations and the majority of the longer steeper slopes will be revegetated prior to the active closure phase. This design concept is commonly used for reducing the potential for gully erosion and has become accepted practice throughout the mining industry. If gully erosion is observed in areas on the storage facilities it will be remedied by a combination of some or all of: armoring, backfilling, recontouring, and revegetation.	Section 5.2 and Chapter 7 of Reclamation and Closure Plan
Project Proposal Chapter 13 (BMC, 2017a)	Install permanent wildlife barrier around ABM lake.	Section 7.2 of Reclamation and Closure Plan
Project Proposal Chapter 13 (BMC, 2017a)	At closure, the ABM lake will be batch treated to maintain water quality within acceptable guidelines for wildlife protection.	Section 7.2 of Reclamation and Closure Plan
Project Proposal Chapter 13 (BMC, 2017a)	Leave haul road in pit to provide egress from ABM lake.	Section 7.2 of the Reclamation and Closure Plan
Project Proposal Chapter 15 (BMC, 2017a)	BMC has committed to working with RRDC in identifying the species that will be used for the reclamation purposes and developing a seed collection program and seed bank in Ross River. Therefore, the potential effects on traditional medicines will be in part mitigated through this program.	Sections 2.5.2 and 7.1.2 of the Reclamation and Closure Plan
Response Report #4A (BMC, 2018b)	Wildlife and Wildlife Habitat – During one of the RRDC Elders Oversight Committee Meetings, one of the Elders indicated that wildlife (moose and caribou) could be at risk of falling in the ABM open pit at closure, based on this knowledge BMC committed to constructing a bund around the highwall edges of the open pit to prevent inadvertent access by wildlife and people (Section 7.2.1 Appendix H-1 of the Project Proposal). In more recent discussions with RRDC Elders it was determined that a second bund would reduce this risk even further. Subsequently, BMC has committed to construct a second bund to ensure protection of wildlife and people (i.e. traditional land users).	Table 7-1 of Reclamation and Closure Plan

Reference No.	Proponent Commitment / Mitigation	Where addressed
Response Report #4A (BMC, 2018b)	Vegetation Cover and Composition - The RRDC Elders have had concerns that the vegetation that is planted or re-established on the Class A Facility will accumulate metals from the tailings below the cover and subsequently the vegetation would not be safe to use for food or medicines. BMC has "designed the covers (high-density polyethylene liner, 3 meters of clean waste rock, overburden and organic soil) to ensure that there is no possibility for the roots of any of the plants on the Class A Facility to encounter the tailings. The Class B facility has been designed the same. Therefore, in post closure the traditional use activities (i.e. berry picking, traditional medicine gathering, and hunting can safely resume). BMC has committed to monitoring the vegetation in collaboration with RRDC/LFN Kaska. Preliminary berry trigger levels are presented in response to YESAB's information request R3-27 (BMC, 2018a). Collaboration by both parties in monitoring, reporting and communicating will to help ensure that the community is re-assured that the design measures are in fact protecting vegetation and that is can safely be consumed by the traditional land users. This strategy is aimed at promoting traditional land use activities in post closure	Sections 7.4 and 7.11.5 of Reclamation and Closure Plan
Decision Document Term #1	The Proponent shall update the geochemical modelling and submit as part of regulatory applications to inform the detailed design of the cover systems and the Waste Rock Management Plan, with the aim of reducing acid production and Contaminants of Potential Interest (COPI) loadings from storage facilities.	Section 2.5.1 of the Reclamation and Closure Plan
Decision Document Term #3	The Proponent shall conduct pilot studies for in-situ pit treatment and the constructed wetland treatment system (CWTS) during operations to confirm their expected performance for all relevant Contaminants of Potential Interest (COPI), optimize their respective designs and ensure timely implementation.	Sections 2.5.3 and 2.5.4 of the Reclamation and Closure Plan
Decision Document Term #4	The Proponent shall implement additional treatment options if the proposed constructed wetland treatment system (CWTS) cannot be demonstrated to reduce Contaminants of Potential Interest (COPI) concentrations to levels that are consistently below the defined regulatory thresholds.	Section 2.5.4.1 of the Reclamation and Closure Plan
Decision Document Term #8	The Proponent shall commit to ongoing geochemical studies for tailings and waste rock storage areas, and studies to optimize the performance of all water treatment facilities and processes to address the potential for acidic conditions to develop in the future.	Sections 2.5.1 and 2.5.4 of the Reclamation and Closure Plan
Decision Document Term #9	The Proponent shall ensure the water treatment plant (WTP) remains operational until it has been demonstrated that surface water from the site meets water quality objectives (WQO) for the receiving environment in Geona Creek (KZ-37) and in Finlayson Creek (KZ-15).	Table 2-1 and Section 8.2 of the Reclamation and Closure Plan
Decision Document Term #12	The Proponent shall ensure that LFN and RRDC have opportunities to participate in and influence the development of environmental and socioeconomic management plans and closure objectives developed for the Project to ensure that Kaska can collaboratively design, collect, report, manage and communicate the results of the monitoring programs and adaptive management plans to their community members. The Proponent will make participant funding available to Kaska to support the incorporation of Kaska perspectives on Kaska laws as well as support the inclusion of Kaska members, including Elders and land stewards, in the regulatory process, the monitoring of impacts, the implementation of adaptive management and the Proponent's commitments for the life of the Project (regulatory to reclamation).	Sections 2.3.1, 2.3.2 and Table 7-1 of the Reclamation and Closure Plan
Decision Document Term #13	The Proponent shall ensure that LFN has the opportunity to be part of the Proponent-Kaska environmental, cultural and heritage management program.	Section 2.3.2 of the Reclamation and Closure Plan
Decision Document Term #19	The setting of security shall take into account the potential for care and maintenance costs required to maintain environmental protections over a period between a temporary closure and decommissioning.	Sections 9.2.14 and 9.3.1 of the Reclamation and Closure Plan
Decision Document Term #20	Security requirements shall take into consideration the potential for early unscheduled closure and the need for care and maintenance requirements to maintain environmental safeguards prior to decommissioning	Sections 9.2.14 and 9.3.1 of the Reclamation and Closure Plan

Reference No.	Proponent Commitment / Mitigation	Where addressed
Decision Document Term #31	The Proponent shall identify alternative/contingency measures for treatment of ABM pit water in their updated comprehensive Adaptive Management Plan (AMP), in regulatory applications. The AMP shall provide descriptions of the types of treatment alternatives and their implementation timelines, in regulatory applications. The Proponent shall identify modelling and monitoring approach including trigger values for when alternatives must be implemented and, if monitoring shows exceedances and alternative treatment is implemented, how discharges will be addressed until new water treatment becomes operational.	Section 7.2.1 of the Reclamation and Closure Plan
Decision Document Term #47	Financial security for the Project should be based upon the peak liabilities in a 5-year period from the point of determination and should not account for revenues generated during the closure period.	Section 9.3 and Appendix E of the Reclamation and Closure Plan
